Preface

The purpose of the *Polymer Handbook* is to bring together the data and constants needed in theoretical and experimental polymer research. All polymer researchers have experienced the frustration of searching for data in the ever-expanding polymer literature and know the difficulties involved in trying to locate a particular constant that is buried in a long journal article. The contributors to this Handbook have taken on the arduous task of searching the literature and compiling the data and constants that polymer chemists, polymer physicists, and polymer engineers are likely to need.

The 520 and odd tables in this Handbook are divided into eight sections. The first lists the IUPAC nomenclature rules for polymers and the International System of Units. Although several naming conventions exist in the technical literature, IUPAC names permit a consistent listing of all polymers. Section II contains data and constants needed for polymer synthesis, kinetic mechanisms, and thermodynamic studies of polymerization and depolymerization reactions. Sections III and IV contain physical constants of monomers, solvents, and oligomers. Section V lists the physical constants of many important commercial polymers. Section VI and VII cover the solid state properties of polymers and the properties of polymer solutions. Section VIII of the Handbook lists the commonly used abbreviations or acronyms for polymers and Chemical Abstract Registry Numbers, and gives suggestions for electronic data searching for polymer information. This section should also be consulted in the few cases where contributors have not used IUPAC nomenclature.

As in the previous editions, the *Polymer Handbook* concentrates on synthetic polymers, poly(saccharides) and derivatives, and oligomers. Few data on biopolymers are included. Spectroscopic data as well as data needed by engineers and designers, such as mechanical and rheological data, are minimized, since many excellent compilations exist elsewhere. Only fundamental constants and parameters that refer to the polymer molecule, that describe the solid state of polymer molecules, or that describe polymer solutions, were compiled. Constants that depend on processing conditions or on sample history were not emphasized, as they can be found in existing plastics handbooks and encyclopedias.

A critical evaluation of the values published in the literature was not attempted, since such a task would have required an inordinate amount of time and a sizable staff. Therefore, the users of this Handbook should consult the original literature for details when in doubt about the validity of any data. (The authors of the individual tables were nevertheless requested to eliminate obviously erroneous data from otherwise complete compilations.)

The Fourth Edition revisions have focused on data generated in the ten years since the publication of the Third Edition. Therefore, a completely revised *Polymer Handbook* has been prepared. We have added new tables and incorporated a large amount of new data into existing tables. As a result, the Fourth Edition contains approximately twenty-five percent more data, and the number of pages has increased from about 1850 in the Third Edition to about 2250.

We hope that this new edition will be as useful to the polymer research community as the three earlier editions and that many of the *Polymer Handbook*'s previous users will also obtain the Fourth Edition for their laboratory and library.

The publisher plans a CD-ROM for the *Polymer Handbook* in the near future. We would be grateful if our contributors and users send us any new data they accumulate in the course of their research, and any errors, misprints, omissions and other flaws. We will pass on such data to the publisher, for the polymer database, and for future editions of this Handbook.

We would like to thank all of the contributors to the *Polymer Handbook* for their help and continued patience. The staff at John Wiley, especially Carla Fjerstad, Shirley Thomas, and Jacqueline Kroschwitz, have provided excellent help and support in getting all the work done. We hope that the outstanding efforts of all these people will find due appreciation among the users of this Handbook.

Contents

Contributors v

Preface ix

I. Nomenclature Rules – Units

Nomenclature I/1
- A. Introduction I/1
- B. IUPAC Recommendations I/1
  - 1. Source-based Nomenclature I/2
    - 1.1 Homopolymers I/2
    - 1.2 Copolymers I/2
    - 1.3 Nonlinear Macromolecules and Macromolecular Assemblies I/3
  - 2. Structure-based Nomenclature I/3
    - 2.1 Regular Single-strand Organic Polymers I/3
    - 2.2 Regular Double-strand Organic Polymers I/6
    - 2.3 Regular Single-strand Inorganic and Coordination Polymers I/6
    - 2.4 Regular Quasi-single-strand Coordination Polymers I/7
    - 2.5 Irregular Single-strand Organic Polymers I/7
- C. Use of Common and Semisystematic Names I/8
- D. Chemical Abstracts (CA) Index Names I/8
- E. Polymer Class Names I/11
- F. References I/12

Units I/13
- A. Introduction I/13
- B. International Units I/13
- C. SI-prefixes I/14
- D. Conversion Factors I/14
- E. Conversion Table for SI vs. English-american Units I/17

II. Polymerization and Depolymerization

Decomposition Rates of Organic Free Radical Initiators II/1
- A. Introduction II/1
- B. Tables of Decomposition Rates of Organic Free Radical Initiators II/2
  - Table 1. Azonitriles II/2
  - Table 2. Miscellaneous Azo-derivatives II/9

A. INTRODUCTION

Macromolecular (polymer) nomenclature has an almost 50-year history. As early as 1949 there existed a Subcommission on Nomenclature within the International Union of Pure and Applied Chemistry (IUPAC) under the chairmanship of Maurice L. Huggins. The Subcommission was part of the IUPAC Commission on Macromolecules, chaired then by Herman F. Mark. Other notable pioneers in polymer science, Jan Joseph Hermans, Otto Kratky, Harry W. Melville, and George J. Smets, were members of the Commission.

The Subcommission produced its first official report in 1952. It recognized then, what is just as true today, that the practice in the field of small molecules of providing rigorous definitions is impractical for polymers. The latter consist of molecules not necessarily exactly of the same size, chemical composition, or structure. The differences result from the presence of end groups, branches, variation in orientation of monomeric units, and irregularity in the sequence of different types of units.

The American Chemical Society (ACS) Division of Polymer Chemistry established its Nomenclature Committee in 1963 to try to unify earlier attempts to name polymers in some coherent way. Their first major project resulted in a structure-based nomenclature for regular linear polymers, first published in ACS Polymer Preprints in 1967, adopted by Chemical Abstracts in 1968, and incorporated in IUPAC recommendations in 1975 [1].

When the IUPAC Commission on Macromolecules was elevated to become the IUPAC Division of Macromolecular Chemistry, the latter in turn established its Commission on Macromolecular Nomenclature in 1968.

The Commission in the course of its nearly 30 years of existence produced a series of major documents that have shaped modern nomenclature and terminology of polymer science. The recommendations are being published in the IUPAC official journal, Pure and Applied Chemistry, and occasionally are republished in the form of a "Compendium" which groups all the currently valid documents in a single volume. The Commission published its "Compendium of Macromolecular Nomenclature" in 1991 [2]. The book, which IUPAC has designated the "Purple Book", in analogy to other IUPAC books ("Blue" – organic, "Red" – inorganic, "Orange" – analytical, "Green"– physical, and "Gold" – overall chemistry), has the two most basic macromolecular nomenclature recommendations: "nomenclature of regular single-strand organic polymers" and "source-based nomenclature for copolymers". In more recent years, the Commission extended that basic nomenclature to double-strand (ladder and spiro) organic polymers, irregular and crosslinked polymers, and polymer blends and interpenetrating networks.

In this article, the basic structure-based and source-based nomenclature of polymers is explained and illustrated in some detail. The continuing use of common and semisystematic nomenclature with reference to specific tables in this Handbook is highlighted. The current Chemical Abstracts (CA) index names [3] are compared and contrasted with the IUPAC practice and typical names employed in the polymer journals and textbooks.

B. IUPAC RECOMMENDATIONS

Since polymers, unlike low-molecular-weight compounds, have no uniform structure and are mixtures of macromolecules of different length and different structural

arrangement, their graphical representation and their names require a special approach.

Often enough, the structure of the polymer has not been sufficiently characterized and the researcher cannot draw its chemical structure. Consequently, no name of the polymer reflecting its structure is possible.

A polymerization reaction for a polymer formed from a monomer such as vinyl chloride can schematically be represented by

$$n\mathrm{CH_2{=}CHCl} \rightarrow \mathrm{\text{-}(CH_2\text{-}CHCl)\text{-}}_n$$

That shows an idealized product. In fact, however, the polymer consists of long-chains of various lengths. The repeating units, $-CH_2-CHCl-$, are not necessarily all uniquely oriented and joined in a regular fashion as shown in the idealized structure above. In addition to "head-to-tail" links

$$\mathrm{\text{-}CH_2\text{-}CHCl\text{-}CH_2\text{-}CHCl\text{-}}$$

other links such as "head-to-head"

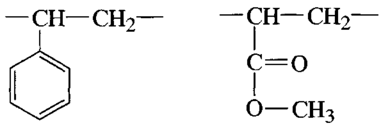
$$\mathrm{\text{-}CHCl\text{-}CH_2\text{-}CH_2\text{-}CHCl\text{-}}$$

and "tail-to-tail"

$$\mathrm{\text{-}CH_2\text{-}CHCl\text{-}CHCl\text{-}CH_2\text{-}}$$

can occur, and the exact sequence of all these repeating units usually is not known.

This becomes even more complicated when a copolymer is derived from more than one monomer, such as styrene and methyl acrylate, which contribute two constitutional or monomeric units:



They can combine into a polymeric chain, resulting in many types such as unspecified, statistical, random, alternating, periodic, block, or graft copolymers.

Because the exact structure of the polymer is not always known, two systems of naming polymers exist:
source-based nomenclature,
structure-based nomenclature.

1. Source-Based Nomenclature

1.1. Homopolymers Homopolymers are derived from only one species of monomer, which may be the actual starting reactant (or source), or be a hypothetical monomer if the homopolymer is formed by a modification of another homopolymer.

The name of the polymer is formed by attaching the prefix "poly" to the name of the actual or assumed monomer, or the starting reactant (source), from which the polymer is derived.

Examples: poly(acrylic acid)
polyacrylonitrile
polybutadiene
polyethylene
poly(methyl methacrylate)
poly(methyl vinyl ether)
polystyrene
poly(tetrafluoroethylene)
poly(vinyl alcohol)
poly(vinyl acetate)
poly(vinyl chloride)
poly(vinylidene dichloride)

Parentheses are used when the name of the monomer consists of two or more words, and when the monomer has substituents.

These are all olefinic type reactants, from which two carbon atoms originally linked by a double bond form a bivalent group:

$$\mathrm{R\text{-}CH{=}CH\text{-}R^1 \rightarrow \text{-}CHR\text{-}CHR^1\text{-}}$$

where R and R^1 represent a hydrogen atom or a substituent group. Many of these are joined, in turn, to each other but their exact orientation or sequence is seldom known.

On the other hand, different polymers derived from a single monomer and having identical constitutional units can still be differentiated by additional information, such as average molecular weight and other chemical and physical characteristics.

1.2. Copolymers For copolymers, the names of monomers are cited after the prefix "poly". In addition, an italicized connective (infix) is placed between the names of monomers to denote the kind of sequential arrangement by which the constitutional (monomeric) units, derived from each monomer, are related in the structure [4].

Seven types of sequence arrangements are listed with their corresponding connectives:

Type	Connective
unknown or unspecified	*-co-*
statistical (obeying known statistical laws)	*-stat-*
random (obeying Bernoullian distribution)	*-ran-*
alternating (for two monomeric units)	*-alt-*
periodic (ordered sequence of more than two)	*-per-*
block (linear arrangement of blocks)	*-block-*
graft (side blocks chains connected to main chain)	*-graft-*

Examples: poly[styrene-*co*-(methyl methacrylate)]
poly(styrene-*stat*-acrylonitrile-*stat*-butadiene)
poly[ethylene-*ran*-(vinyl acetate)]
poly[(ethylene glycol)-*alt*-(terephthalic acid)]
poly[formaldehyde-*per*-(ethylene oxide)-*per*-(ethylene oxide)]
polystyrene-*block*-polybutadiene
polybutadiene-*graft*-polystyrene

The names of the monomers are those common or semisystematic names that are encountered most often in the literature of polymer science. The order of citation of monomers in copolymer names is arbitrary.

An equally acceptable alternative scheme for naming copolymers utilizes the prefix "copoly", followed by citation of the names of the monomers, separated by an oblique stroke (a solidus). Parentheses are not needed to enclose monomer names consisting of two or more words.

Examples: copoly(styrene/methyl methacrylate)
stat-copoly(styrene/acrylonitrile/butadiene)
ran-copoly(ethylene/vinyl acetate)
alt-copoly(ethylene glycol/terephthalic acid)
per-copoly(formaldehyde/ethylene oxide/ethylene oxide)
block-copoly(styrene-butadiene)
graft-copoly(butadiene-styrene)

1.3. Nonlinear Macromolecules and Macromolecular Assemblies

Most recently, the source-based nomenclature has been extended for non-linear macromolecules and macromolecular assemblies [5]. The non-linear macromolecules comprise branched, graft, comb, star, cyclic, and network macromolecules. The macromolecular assemblies comprise polymer blends, interpenetrating polymer networks, and polymer–polymer complexes.

The following italicized qualifiers can be used as both prefixes (e.g., *blend-*, *net-*) and infixes (connectives) (e.g., *-blend-*, *-net-*) to designate the skeletal structure of non-linear macromolecules or macromolecular assemblies:

Type	Connective
cyclic	*cyclo*
branched, unspecified	*branch*
short-chain-branched	*sh-branch*
long-chain-branched	*l-branch*
branched with branch point of functionality *f*	*f-branch*
comb	*comb*
star	*star*
star with *f* arms	*f-star*
network	*net*
crosslink	ι (Greek iota)
polymer blend	*blend*
interpenetrating polymer network	*ipn*
semi-interpenetrating polymer network	*sipn*
polymer–polymer complex	*compl*

In naming non-linear homopolymer molecules, the italicized prefix for the skeletal structure of the macromolecule is placed *before* the source-based name of the constituent linear chain.

Assemblies of macromolecules held together by non-covalent bonds are named by a combination of the names of the constituent macromolecules with an italicized connective between them.

Examples: polystyrene-*comb*-polyacrylonitrile
comb-poly(styrene-*stat*-acrylonitrile)
polystyrene-*comb*-[polyacrylonitrile; poly(methyl methacrylate)]
4-*star*-polystyrene
star-(polyA-*block*-polyB-*block*-polyC)
star-(polyA; polyB; polyC)
star-(polyacrylonitrile; polystyrene) (M_r 100000 : 20000)
net-polystyrene-ι-divinylbenzene
net-poly[styrene-*alt*-(maleic anhydride)]-ι-(ethylene glycol)
polystyrene-*blend*-poly(2,6-dimethylphenol)
poly(methyl methacrylate)-*blend*-poly(*n*-butyl acrylate)
(*net*-polystyrene)-*sipn*-poly(vinyl chloride)
[*net*-poly(styrene-*stat*-butadiene]-*ipn*-[*net*-poly(ethyl acrylate)

2. Structure-Based Nomenclature

2.1. Regular Single-Strand Organic Polymers

For regular organic polymers which have only one species of constitutional repeating unit (CRU) in a single sequential arrangement and consist of single strands only, the name is

poly(constitutional repeating unit),

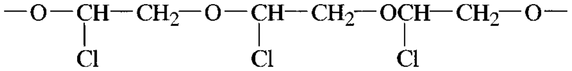
wherein the repeating group is named as a bivalent organic group according to the IUPAC nomenclature rules for organic compounds [1]. Each such repeating group can consists of simple or substituted subunits such as:

$-CH_2-$	methylene
$-CH_2CH_2-$	ethylene
$-CH{=}CH-$	vinylene
$-CH_2CH_2CH_2CH_2CH_2CH_2-$	hexane-1,6-diyl
$-CHCl-CH_2-$	1-chloroethylene
$-COCH_2-CH_2-$	1-oxopropane-1,3-diyl
$-COCH_2CH_2CH_2CH_2CO-$	adipoyl
	1,4-phenylene
	cyclohexane-1,4-diyl
$-O-$	oxy
$-S-$	thio
$-SO_2-$	sulfonyl
$-NH-$	imino
$-N(CH_3)-$	methylimino
$-NHNH-$	hydrazo
	piperidine-1,4-diyl
$-SiH_2-$	silanediyl
$-Si(CH_3)_2-$	dimethylsilanediyl

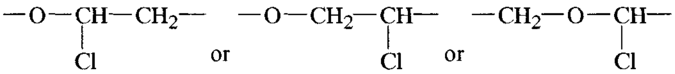
Before the total constitutional repeating unit (CRU) can be given a unique name, a single preferred CRU must be selected.

References page I - 12

For instance, in a polymer such as



it is immediately evident that a three-atom group (oxygen, chlorine-substituted methylene group, and methylene group) are being regularly repeated. Yet, the CRU can be identified in at least three ways



To obtain a unique name based on a preferred CRU, several rules have to be applied. Rules have been developed to specify both seniority among subunits, that is, the point at which to begin writing the CRU, and also the direction in which to move along the chain from left to right to reach the end of the chain.

The order of seniority among the types of bivalent groups that are parts of the chain of a single-strand polymer is

a. heterocycles, e.g., piperidine-1,4-diyl: 
thiophene-2,5-diyl: 
b. heteroatomic acyclic groups, e.g., oxy: –O–, sulfonyl: $-SO_2-$, imino: –NH–

c. carbocycles, e.g., 1,4-phenylene: 
cyclobutane-1,3-diyl: 
d. carbon-containing acyclic groups, e.g., 1-chloroethylene: $-CHCl-CH_2-$ propane-1,3-diyl: $-CH_2-CH_2-CH_2-$

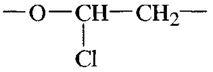
Within each structural type, the seniority is established by further criteria:

a. for heterocycles, a ring system containing nitrogen is senior to a system containing a hetero atom other than nitrogen, with further descending order of seniority governed by the greatest number of rings in the ring system, the largest individual ring in the ring system, the largest number of hetero atoms, and the greatest variety of hetero atoms;
b. for heteroatomic acyclic chains, oxygen is senior to sulfur, sulfur to nitrogen, nitrogen to phosphorus, phosphorus to silicon, silicon to germanium, etc.;
c. for carbocycles, a three-ring system is senior to a two-ring system, a two-ring system containing two 6-membered rings is senior to one containing a 5- and a 6-membered rings, a fused two-ring system (two atoms common to both rings) is senior to a spiro two-ring system (one atom in common), and an unsaturated ring is senior to a saturated ring of the same size;
d. for carbon-only acyclic chains, seniority is determined first by length, then by the number of substituents, by the ascending order of locants, and, finally, by the alphabetical order of the names of the substituent groups.

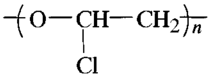
In all cases, the basic seniority rules apply only to those atoms or groups of atoms that are in the main chain. The kinds of substituents on the main chain (whether acyclic carbon-only groups, or hetero-atom-containing groups, or any ring systems) do not affect the selection of the CRU, unless identical basic subunits in the chain have to be further differentiated by the number of substituents and their alphabetical order, but not by the type of the substituent.

If completely identical subunits are separated by other subunits, the direction of citation is determined by the shorter part between them.

The preferred CRU is the one beginning with the subunit of highest seniority. To establish direction, one proceeds from this subunit to the neighboring subunit of the same or next in seniority. In the example of a poly(chloroethylene oxide), shown above, where a regularly repeating structure has been assumed, the subunit of the highest seniority is the oxygen atom and the subunit next in seniority is a substituted $-CH_2-CH_2-$. The substituted subunit, $-CHCl-CH_2-$, is oriented in such a way that the substituent, chlorine atom, is assigned the lowest locant (1 rather than 2). The CRU is written to read from left to right. Thus, the preferred CRU is



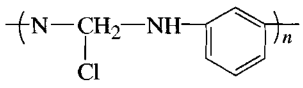
and the polymer



is named

poly[oxy(1-chloroethylene)]

The second example:

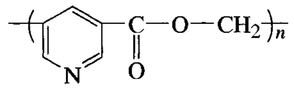


poly[(methylimino)methyleneimino-1,3-phenylene]

illustrates a polymer whose CRU starts with a substituted nitrogen atom and proceeds through the shortest path to the unsubstituted nitrogen atom and then through a carbocycle.

The chemical structure of the CRU is enclosed in parentheses or brackets. While dashes representing chemical bonds may be omitted within the formula unless necessary for clarity, at the ends of the CRU, dashes must be shown. They are drawn across the enclosing marks.

The third example:

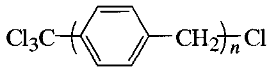


poly(pyridine-3,5-diylcarbonyloxymethylene)

shows a polymer, whose CRU starts with a heterocycle and then proceeds through a substituted carbon atom to a hetero atom.

If the end groups of the chain are known, they may be specified by adding prefixes to the polymer name, with the symbol α denoting the left-hand end group and the symbol ω denoting the other end group.

Example:



α-(trichloromethyl)-ω-chloropoly(1,4-phenylene-methylene)

The following table compares and contrasts structure-based and source-based names of some common polymers.

Structure	Structure-based name	Source-based or trivial name
$-(CH_2CH_2)-_n$	Poly(methylene)	Polyethylene
$-(CH(CH_3)CH_2)-_n$	Poly(propylene)	Polypropene
$-(C(CH_3)_2CH_2)-_n$	Poly(1,1-dimethylethylene)	Polyisobutylene
$-(C(CH_3){=}CHCH_2CH_2)-_n$	Poly(1-methyl-1-butenylene)	Polyisoprene
	Poly(1-phenylethylene)	Polystyrene
$-(CH(Cl)CH_2)-_n$	Poly(1-chloroethylene)	Poly(vinyl chloride)
$-(CH(CN)CH_2)-_n$	Poly(1-cyanoethylene)	Polyacrylonitrile
$-(CH(OCOCH_3)CH_2)-_n$	Poly(1-acetoxyethylene)	Poly(vinyl acetate)
$-(CF_2CH_2)-_n$	Poly(1,1-difluoroethylene)	Poly(vinylidene fluoride)
$-(CF_2CF_2)-_n$	Poly(difluoromethylene)	Polytetrafluoroethylene
	Poly[(2-propyl-1,3-dioxane-4,6-diyl)methylene]	Poly(vinyl butyral)
$-(C(CH_3)(COOCH_3)CH_2)-_n$	Poly[1-(methoxycarbonyl)-1-methylethylene]	Poly(methyl methacrylate)
$-(OCH_2CH_2)-_n$	Poly(oxyethylene)	Poly(ethylene oxide)
	Poly(oxy-1,4-phenylene)	Poly(phenylene oxide)
$-(NH-C(=O)-(CH_2)_5)-_n$	Poly[imino(1-oxohexane-1,6-diyl)]	Poly(ε-caprolactam)
	Poly(oxyethyleneoxyterephthaloyl)	Poly(ethylene terephthalate)
$-(NH-C(=O)(CH_2)_4C(=O)-NH(CH_2)_6)-_n$	Poly(iminoadipoyliminohexamethylene)	Poly(hexamethylenediamine-*alt*-adipic acid) *or* poly(hexamethylene adipamide)
	Poly[(2,5-dioxotetrahydrofuran-3,4-diyl)(1-phenylethylene)]	Poly(maleic anhydride-*alt*-styrene)

References page I-12

2.2. Regular Double-Strand Organic Polymers In a double-strand polymer, the macromolecules consist of an uninterrupted sequence of rings with adjacent rings having two or more atoms in common (a ladder polymer) or one atom in common (a spiro polymer).

As for a single-strand polymer, a single preferred constitutional repeating unit (CRU) must be selected in order to obtain a unique name [6]. The CRU is usually a tetravalent group denoting attachment to four atoms and is named according to the usual rules of organic nomenclature. Again, the name of the polymer is in the form of

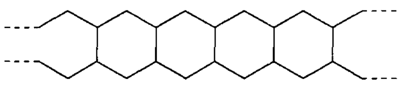
poly(constitutional repeating unit)

Since the polymer has a sequence of rings, in order to identify a preferred CRU, the rings must be broken by observing the following criteria in decreasing order of priority:

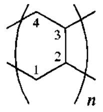
a. minimize the number of free valences in the CRU,
b. maximize the number of most preferred hetero atoms in the ring system,
c. retain the most preferred ring system, and
d. choose the longest chain for acyclic CRU.

Further decisions are based on the seniority of ring systems (indicated in the preceding section), on the orientation of the CRU to give the lowest free valence locant at the lower left of the structural diagram, and on placing the acyclic subunits, if any, on the right side of the ring system within the CRU.

For a polymer consisting of adjacent 6-membered saturated carbon rings:



the name of the preferred CRU, which in this case is an acyclic chain of four carbon atoms with four free valences at each atom (the lowest at the lower left), is



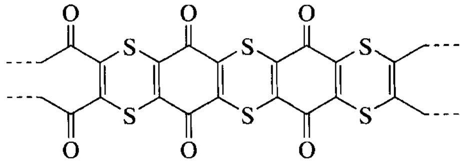
poly(butane-1,4 : 3,2-tetrayl)

The free valence locants are always placed just in front of the corresponding ending of the tetravalent unit and are cited in the order

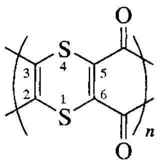
lower-left, upper-left : upper-right, lower-right

that is, in a clockwise direction, the left locants being separated from the right locants by a colon.

For a more complex ladder polymer consisting of an alternating sequence of 6-membered sulfur-containing rings and keto-group containing carbocycles, with two atoms in common at each junction:



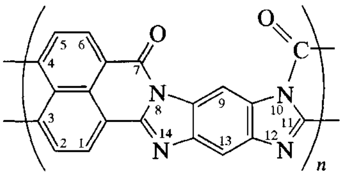
the name based on the preferred CRU is



poly(1,4-dithiin-2,3 : 5,6-tetrayl-5,6-dicarbonyl)

Here, by applying the seniority of the rings system, the heterocycle was left intact, but the carbocycle was broken. That left two bivalent acyclic subunits (carbonyl groups), which according to the rule, have been placed on the right side of the cyclic subunit, with attachments as in the original polymer.

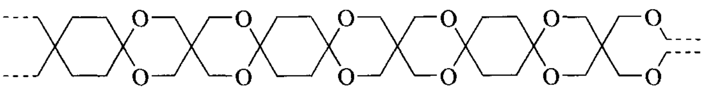
Another, still more complex ladder polymer, derived from the polycondensation of 1,4,5,8-naphthalenetetracarboxylic dianhydride with 1,2,4,5-benzenetetramine:



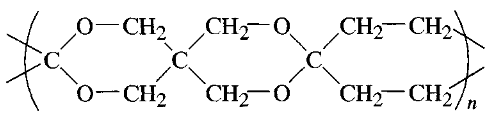
poly[(7-oxo-7*H*,10*H*-benz[*de*]imidazo[4′,5′ : 5,6]benzimidazo [2,1-*a*]isoquinoline-3,4:10,11-tetrayl)-10-carbonyl]

illustrates a six-ring system with four free valences oriented in such a way that the lowest free valence locant is at lower left. It is followed within the total CRU by an acyclic group at the upper right side of the diagram.

For a polymer consisting of regularly repeating adjacent cyclohexane and 1,3-dioxane rings in a spiro sequence (one atom in common at each junction):



the preferred CRU and the name are:



poly(2,4,8,10-tetraoxaspiro[5.5]undecane-3,3:9,9-tetrayl-9,9-diethylene)

2.3. Regular Single-Strand Inorganic and Coordination Polymers The names of inorganic and coordination polymers are based on the fundamentals developed for organic polymers [7]. As in the nomenclature of organic polymers, these rules apply to structural representations

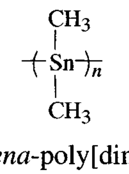
which may at times be idealized and do not take into account irregularities, chain imperfections, or random branching.

A constitutional repeating unit (CRU) is selected and named. However, because of the basic difference between the organic and inorganic nomenclature, the subunits of the CRU are not named as bivalent groups, but as inorganic or coordination groups indicating covalent and/or coordinate bonding.

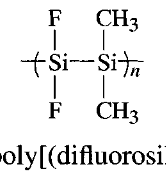
The name of the polymer is the name of the CRU prefixed by the term "poly", "*catena*", or other structural indicator. In order to arrive at the preferred CRU, seniorities of the constitutent subunits are considered as well as the preferred direction for the sequential citation.

The constituent subunit of the highest seniority must contain one or more central atoms; bridging groups between central atoms in the backbone of the polymer are of lower seniority. This is consistent with the principle of coordination nomenclature which puts the emphasis on the coordination center.

Examples of homoatomic backbones are

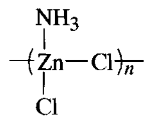


catena-poly[dimethyltin]

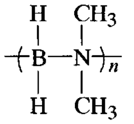


catena-poly[(difluorosilicon)(dimethylsilicon)]

More common coordination polymers consist of a mononuclear central atom with a bridging ligand. The CRU of such a polymer cites the central atom first, which is prefixed by its associated non-bridging ligands, followed in turn by the name of the bridging ligand prefixed by the Greek letter μ:

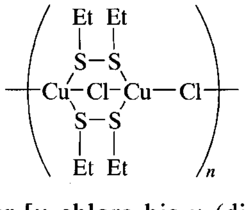


catena-poly[(ammine-chlorozinc)-μ-chloro]



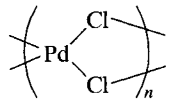
catena-poly[(dihydro-boron)-μ-(dimethylamido)]

Multiple bridging ligands between the pair of central atoms are cited in alphabetic order. Italicized element symbols indicating the coordinating atoms in bridging ligands are cited in the order of direction of the CRU and are separated by a colon:

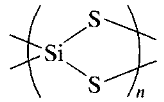


catena-poly[copper-[μ-chloro-bis-μ-(diethyl disulfide-*S*:*S*′)]-copper-μ-chloro]

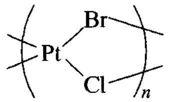
2.4. Regular Quasi-Single-Strand Coordination Polymers In a regular quasi-single-strand coordination polymer, the preferred CRU has one terminal constituent subunit connected through a single atom to the next CRU [7]. Such polymers are named as single-strand coordination polymers:



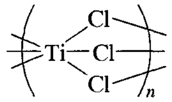
catena-poly[palladium-di-μ-chloro]



catena-poly[silicon-di-μ-thio]



catena-poly[platinum(μ-bromo-μ-chloro)]

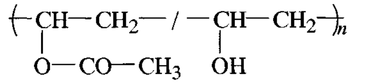


catena-poly[titanium-tri-μ-chloro]

2.5. Irregular Single-Strand Organic Polymers Irregular polymers are named by placing the prefix "poly" before the structure-based names of the constitutional units, collectively enclosed in parentheses or brackets, with the individual constitutional units separated by an oblique stroke (a solidus) [8]. The stroke indicates the irregular or unknown sequential arrangement of these units. The dashes at each end of the formula are drawn *fully inside* the enclosing marks to denote that these are not necessarily terminal bonds of the macromolecule.

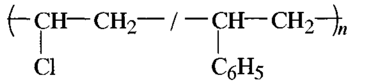
For instance, a partially hydrolyzed poly(vinyl acetate) containing units:

 and 
is represented graphically and named:



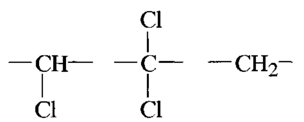
poly(1-acetoxyethylene/1-hydroxyethylene)

A copolymer of vinyl chloride and styrene joined head-to-tail is



poly(1-chloroethylene/1-phenylethylene)

A chlorinated polyethylene consisting of units



is shown and named as

$\text{+CHCl-/-CCl}_2\text{-/-CH}_2\text{-+}_n$

poly(chloromethylene/dichloromethylene/methylene)

C. USE OF COMMON AND SEMISYSTEMATIC NAMES

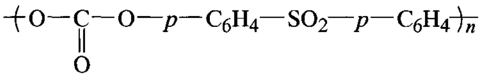
The main purpose of chemical nomenclature is to identify a chemical species by means of written or spoken words for a useful communication among chemists. A systematic nomenclature arose from the need to provide a relationship between the structure and the name. In other words, the reader should be able to deduce and identify the structure from the name.

Traditional names, however, not necessarily based on structures, have been widely used for many common compounds. These are the so-called common, trivial, or semisystematic names, which are satisfactory for communication within a given special chemical field.

It was earlier stated that in the macromolecular nomenclature IUPAC is recommending the use of common and semisystematic names for monomers in the source-based polymer names. The structure-based names, on the other hand, are more related to the structural characteristic of the polymers. But even there, IUPAC allows for a limited number of common names for such substituent groups as "allyl" and "vinyl", and for bivalent groups such as "adipoyl" and "terephthaloyl".

The authors in this *Handbook* for the most part are using the IUPAC-recommended names, or very close variants thereof. On the other hand, in some compilations such as "Crystallographic Data for Various Polymers" (in Section VI), the author provides an excellent introduction and explanation of the names used. For some structure-based names, reflecting constitutional repeating units (CRU), especially for those with a center of symmetry, the naming of linking bivalent groups begins with the central subunit and proceeds in both directions. The IUPAC method selects the most senior bivalent group and proceeds naming from left to right.

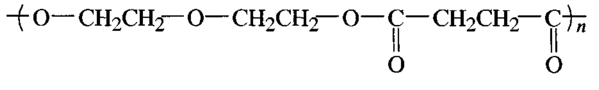
Examples:



Handbook name: poly(4,4′-sulfonyldiphenylene carbonate)

IUPAC name: poly(oxycarbonyloxy-1,4-phenylenesulfonyl-1,4-phenylene)

2.



Handbook name: poly(oxydiethylene succinate)

IUPAC name: poly(oxyethyleneoxyethyleneoxysuccinyl)

In no case, there is any misunderstanding in either case as to which structure is associated with each name.

Abbreviations and acronyms are also extensively used in the chemical literature for monomers, polymers, as well as for additives, modifiers, and fillers. Their extensive list is provided in Section VIII of this Handbook.

As is clearly stated there, the same abbreviation is often used for different monomers and polymers, and the same polymer may have different abbreviations or acronyms.

Examples:

1. DPP	diphenyl phthalate
	dipropyl phthalate
2. PVA	poly(vinyl alcohol)
	poly(vinyl acetate)
3. trioctyl phosphate	TOF
	TOP
4. polyacrylonitrile	PAC
	PAN

The IUPAC policy [9] on the use of abbreviations in the chemical literature states that there are great advantages in defining all abbreviations in a single conspicuous place in each paper, preferably near the beginning of the paper in a single list. An alternative is to define each abbreviation fully the first time it appears in the text. No abbreviations should be used in the titles of publications. A chapter of this Handbook contains a set of abbreviations recognized by international organizations.

D. CHEMICAL ABSTRACTS (CA) INDEX NAMES

Chemical Abstracts Service (CAS), the publisher of printed Chemical Abstracts (CA) and corresponding products and services in microform, online databases, CD-ROM, and World Wide Web also names the polymers, selected for inclusion in the CAS Chemical Registry System and in the *CA Chemical Substance Indexes*, in two ways:

a. in terms of the component monomer(s) from which they are prepared
b. in terms of the final structure of the resulting polymer.

There are definitive rules that govern when each type of structure is recorded and named [3]. The *primary*, comprehensive representation of polymers by CAS is by citation of the component monomer(s) because, in many cases, the structure of the final polymer is either not known or is not described in sufficient detail by the author.

When the polymer structure is well documented by the author or can be confidently assumed, because one and only one structure is chemically possible, then a *supplementary* representation with a corresponding systematic name is added to the CAS Registry System and included in the printed indexes and online files.

The chemical nomenclature used by CAS has developed in parallel, and generally in accordance, with the rules and recommendations published by IUPAC. However, their rules of systematic nomenclature do not necessarily lead to a unique name for each compound, but do lead to an unambiguous one. This causes no difficulty in normal scientific communication, but is unacceptable in a formal, rigidly controlled, alphabetic listing such as the CA Chemical Substance Index.

The CA index names must not only be unambiguous, unique, and totally reproducible, but also selected so as to bring the names of structurally related substances into juxtaposition in the alphabetic index. CAS has always recognized that, while a unique name is needed for an index and for substance identification, the use of such invariant name in scientific papers is neither practicable nor desirable.

In this section, it is intended to highlight the characteristics of the CA index names for polymers and compare them with some of the typical names used in the scientific community.

a. IUPAC rules have been adapted to the specific needs of a highly ordered alphabetical index.
b. Most common names were eliminated and exceptional treatment for various classes of substances was discontinued.
c. A single preferred name is determined for each identifiable substance.
d. A strict order of precedence of chemical functions and compound classes is followed to determine the preferred "index heading parent".
e. A total name is "inverted" by citing first the *index heading parent* (usually, basic skeleton name with a locant and suffix denoting the principal function), followed by the *comma of inversion*, the *substituents*, and the *modification* (derivative of the principal function), e.g., 2-propenoic acid, 2-methyl-, methyl ester

As mentioned above, most common names, including those still sanctioned by IUPAC, have been replaced by fully systematic names. The following is a short list of most common monomers with both common names and CA Index names:

Common	CA Index names (inverted form)
acrylamide	2-propenamide
acrylic acid	2-propenoic acid
acrylonitrile	2-propenamide
adipic acid	hexanedioic acid
ε-caprolactam	2*H*-azepin-2-one, hexahydro-
ε-caprolactone	2-oxepanone
ethylene glycol	1,2-ethanediol
ethylene oxide	oxirane
fumaric acid	2-butenedioic acid, (*E*)-
glycolic acid	acetic acid, hydroxy-
hydroquinone	1,4-benzenediol
isophthalic acid	1,3-benzenedicarboxylic acid
lactic acid	propanoic acid, 2-hydroxy-
maleic acid	2-butenedioic acid, (*Z*)-
maleic anhydride	2,5-furandione
melamine	1,3,5-triazine-2,4,6-triamine
methacrylic acid	2-propenoic acid, 2-methyl-
methyl acrylate	2-propenoic acid, methyl ester
phthalic anhydride	1,3-isobenzofurandione
propylene oxide	oxirane, methyl-
styrene	benzene, ethenyl-
terephthalic acid	1,4-benzenedicarboxylic acid
vinyl alcohol	ethenol
vinyl chloride	ethene, chloro-
vinylidene chloride	ethene, 1,1-dichloro-

Similarly, commonly named substituent and multiplying groups have their systematic equivalents in CA Indexes:

adipoyl	1,6-dioxo-1,6-hexanediyl
allyl	2-propenyl
tert-butyl	1,1-dimethylethyl
ethylene	1,2-ethanediyl
hexamethylene	1,6-hexanediyl
isopropyl	1-methylethyl
succinyl	1,4-dioxo-1,4-butanediyl
vinyl	ethenyl
vinylene	1,2-ethenediyl

Homopolymers are described by the term "homopolymer" cited in the *modification* under the monomer name in the index. In the structural diagram derived from the CAS Registry System records, the structure of the monomer is enclosed in parentheses followed by a subscript "x". The corresponding empirical formula is also expressed in a similar way.

Examples:

1. Poly(methacrylic acid):
   $(CH_2{=}CH{-}COOH)_x$ (with CH_3 on the CH)
   $(C_4H_6O_2)_x$
   CA name: 2-Propenoic acid, 2-methyl-, homopolymer
2. Polystyrene:
   $(CH_2{=}CH)_x$ (with C_6H_5 on the CH)
   $(C_8H_8)_x$
   CA name: Benzene, ethenyl-, homopolymer
3. Poly(11-aminoundecanoic acid):
   $(H_2N{-}(CH_2)_{10}{-}COOH)_x$
   $(C_{11}H_{23}NO_2)_x$
   CA name: Undecanoic acid, 11-amino-, homopolymer

References page I-12

4. Poly(lactic acid):
      $(C_3H_6O_3)_x$
   CA name: Propanoic acid, 2-hydroxy-, homopolymer

Copolymers formed from two or more monomers are described by the term "polymer with" (followed by the other monomers in alphabetical order) cited in the *modification* under each monomer name. In the structural diagram derived from the CAS Registry System records, the structures of monomers, separated by a period or periods, are enclosed in parentheses followed by a subscript "x". The corresponding empirical formulas are similarly expressed. The descriptors *alternating, block*, and *graft* are cited whenever applicable.

Examples:

1. Butadiene-vinyl ethyl ether copolymer:
   $(CH_2{=}CH{-}CH{=}CH_2{\cdot}CH_2{=}CH{-}O{-}CH_2CH_3)_x$
   $(C_4H_8O{\cdot}C_4H_6)_x$ (in Formula Index order)
   CA names: 1,3-Butadiene, polymer with ethoxyethene
   Ethene, ethoxy-, polymer with 1,3-butadiene
2. Isophthalic acid-terephthalic acid-ethylene glycol polyester:
   (HOOC-*m*-C_6H_4–COOH·HOOC-*p*-C_6H_4–COOH·OH–$(CH_2)_2$–OH$)_x$
   $(C_8H_6O_4{\cdot}C_8H_6O_4{\cdot}C_2H_6O_2)_x$
   CA names: 1,3-Benzenedicarboxylic acid, polymer with 1,4-benzenedicarboxylic acid and 1,2-ethanediol
   1,4-Benzenedicarboxylic acid, polymer with 1,3-benzenedicarboxylic acid and 1,2-ethanediol
   1,2-Ethanediol, polymer with 1,3-benzenedicarboxylic acid and 1,4-benzenedicarboxylic acid

Telomers are named as copolymers with the term "telomer with" cited in the *modification* under both the monomer (taxogen) and the chain-transfer agent (telogen). In the structural representation, the monomer is enclosed in parentheses with a subscript "x", followed by the telogen structure. The corresponding empirical formula is expressed in the same way.

Examples:

1. Vinylpyrrolidone homopolymer terminated with mercaptopropionic acid:
      $(C_6H_9NO)_x{\cdot}C_3H_6O_2S$
   CA names: 2-Pyrrolidinone, 1-ethenyl-, telomer with 3-mercaptopropanoic acid
   Propanoic acid, 3-mercapto-, telomer with 1-ethenyl-2-pyrrolidinone
2. Acrylic acid-vinyl choride copolymer terminated with carbon tetrachloride:
   $(CH_2{=}CH{-}COOH{\cdot}Cl{-}CH{=}CH_2)_x{\cdot}CCl_4$
   $(C_3H_4O_2{\cdot}C_2H_3Cl)_x{\cdot}CCl_4$
   CA names: 2-Propenoic acid, telomer with chloroethene and tetrachloromethane
   Ethene, chloro-, telomer with 2-propenoic acid and tetrachloromethane
   Methane, tetrachloro-, telomer with chloroethene and 2-propenoic acid

Structural repeating units (SRU), equivalent to IUPAC constitutional repeating units (CRU), are selected and named for polymers that have well documented regular structure, or can confidently be assumed. Assumptions are made for

a. polyamides formed from a dibasic acid (ester or halide) and a diamine; from an amino acid (ester or halide); from a lactam;
b. polyesters formed from a dibasic acid (anhydride, ester, or halide) and a dihydric alcohol (phenol); from a hydroxy acid (ester, halide); from a lactone;
c. polycarbonates formed from carbonic acid (ester, dihalide) and a dihydric alcohol (phenol);
d. polyurethanes formed from a diisocyanate and a dihydric alcohol (phenol).

The structural repeating unit is named by citation of one or more multivalent radicals of regular substitutive nomenclature. The selection of the preferred SRU, its orientation, and the construction of the name, proceeding from left to right, follows the same rules as those in the IUPAC recommendations for the CRU. In CA names, however, the names of the radicals are fully systematic, as explained and contrasted above. The empirical formula is enclosed in parentheses followed by a subscript "n".

Examples:

1. Nylon 11:
      $(C_{11}H_{21}NO)_n$
   CA name: Poly[imino(1-oxo-1,11-undecanediyl)]
2. Poly(ethylene adipate):
      $(C_8H_{12}O_4)_n$
   CA name: Poly[oxy-1,2-ethanediyloxy(1,6-dioxo-1,6-hexanediyl)]

3. Poly(ether ether ketone) (PEEK):

$$-\!\!\left(\mathrm{O}-p\text{-}\mathrm{C_6H_4}-\mathrm{O}-p\text{-}\mathrm{C_6H_4}-\overset{\overset{\displaystyle \mathrm{O}}{\|}}{\mathrm{C}}-p\text{-}\mathrm{C_6H_4}\right)_{\!n}\!-$$

$(C_{19}H_{12}O_3)_n$

CA name: Poly(oxy-1,4-phenyleneoxy-1,4-phenylenecarbonyl-1,4-phenylene)

Poly(alkylene glycols) and their ethers and esters are indexed in CA as structural repeating units with the specified end groups, if aplicable.

Examples:

1. Poly(ethylene glycol):
   $H(O-CH_2-CH_2)_nOH$
   CA name: Poly(oxy-1,2-ethanediyl), α-hydro-ω-hydroxy-
2. Poly(trimethylene glycol) dimethyl ether:
   $CH_3(O-CH_2-CH_2-CH_2)_nO-CH_3$
   CA name: Poly(oxy-1, 3-propanediyl), α-methyl-ω-methoxy-
3. Poly(tetramethylene glycol) diacrylate:
   $CH_2{=}CH-C(O)(O-CH_2-CH_2-CH_2-CH_2)_n O-C(O)-CH{=}CH_2$
   CA name: Poly(oxy-1, 4-butanediyl), α-(1-oxo-2-propenyl)-ω-[(1-oxo-2-propenyl)oxy]-

E. POLYMER CLASS NAMES

In most textbooks, handbooks, encyclopedias, and indexes to polymer nomenclature, information on polymer is grouped under polymer class names. The following is a list of such terms extracted from these sources.

Acrylic Polymers
Alkyd resins
Aminoplasts
Coumarone-indene-resins
Epoxy resins
Fluoropolymers
Phenolic resins
Polyacetals
Polyacetylenes
Polyacrylics
Polyalkylenes
Polyalkenylenes
Polyalkynylenes
Polyamic acids
Polyamides
Polyamines
Polyanhydrides
Polyarylenealkenylenes
Polyarylenealkylenes
Polyarylenes
Polyazomethines
Polybenzimidazoles
Polybenzothiazoles
Polybenzoxazinones
Polybenzoxazoles
Polybenzyls
Polycarbodiimides
Polycarbonates
Polycarboranes
Polycarbosilanes
Polycyanurates
Polydienes
Polyester-polyurethanes
Polyesters
Polyetheretherketones
Polyether-polyurethanes
Polyethers
Polyhydrazides
Polyimidazoles
Polyimides
Polyimines
Polyisocyanurates
Polyketones
Polyolefins
Polyoxadiazoles
Polyoxides
Polyoxyalkylenes
Polyoxyarylenes
Polyoxymethylenes
Polyoxyphenylenes
Polyphenyls
Polyphosphazenes
Polypyrroles
Polypyrrones
Polyquinolines
Polyquinoxalines
Polysilanes
Polysilazanes
Polysiloxanes
Polysilsesquioxanes
Polysulfides
Polysulfonamides
Polysulfones
Polythiazoles
Polythioalkylenes
Polythioarylenes
Polythioethers
Polythiomethylenes
Polythiophenylenes
Polyureas
Polyurethanes
Polyvinyl acetals
Polyvinyl butyrals
Polyvinyl formals
Vinyl polymers

These classes are not mutually exclusive, some are relatively generic and some more specific. Some of them

References page I-12

could be grouped and arranged in a hierarchy, e.g.,

Polyacetals	Polyethers
Polyvinyl acetals	epoxy resins
polyvinyl butyrals	polyetheretherketones
polyvinyl formals	polyoxyalkylenes
	polyoxymethylenes
Polyesters	polyoxyarylenes
polycarbonates	polyoxyphenylenes

Some are synonymous or near synonymous, e.g., polyalkenylenes and polydienes, polyalkynylenes and polyacetylenes, polyethers and polyoxides, polythioethers and polysulfides.

B. International Units I-13
C. SI-Prefixes I-14
D. Conversion Factors I-14
E. Conversion Table for SI vs. English–American Units I-17

A. INTRODUCTION

The International System of Units (1) is used in this Handbook as far as possible, since this system has become obligatory in many European countries and since it is supported by the National Bureau of Standards (2) and the American Society for Testing and Materials (3). Only cursory information is given here for units needed in this Handbook. Detailed information may be found in the following References:

1. "SI-units and recommendations for the use of their multiples and of certain other units", ISO 1000–1973.
2. "The International System of Units (SI)", Eds. C. H. Page, P. Vigoreux, Natl. Bur. Std. Spec. Publ., 1981, 330.
3. "Standard Metric Practice Guide", ASTM E-380–85.
4. Manual of Symbols and Terminology for Physicochemical Quantities and Units; Pergamon Press, Oxford 1979 (Pure Appl. Chem., **51**, 1 (1979).
5. F. S. Conant, using the SI units, Polym. Eng. Sci., **17**, 222 (1977) (further references).

B. INTERNATIONAL UNITS

Quantity	SI-unit	Selection of multiples of the SI-unit	Accepted units used with SI	Units accepted temporarily	Non SI units that should not be used
Length	m (metre)	km, cm, mm, μm, nm		1 Å = 10^{-10} m	1 μ = 10^{-6} m
Area	m^2	km^2, dm^2, cm^2, mm^2			
Volume	m^3	dm^3, cm^3, mm^3	litre (l, L) (1 l = 1 dm^3)		
Time	s (second)	ks, ms, μs, ns	d, h, min		
Frequency	Hz (hertz)	THz, GHz, MHz, kHz			
Mass	kg (kilogram)	Mg, g, mg, μg	t		1γ = 10^{-9} kg
Density	kg/m^3	mg/m^3; kg/dm^3; g/cm^3	t/m^3; kg/l		
Force	N (newton)	MN, kN, mN, μN			1 dyn = 10^{-5} N; pond, kilopond
Pressure	Pa (pascal) or N/m^2	GPa, MPa, kPa, mPa, μPa		1 bar = 10^5 Pa 1 atm = 101325 Pa	$1\ \text{Torr} = \frac{101325}{760}\ \text{Pa} = 133.32\ \text{Pa}$
Stress	Pa or N/m^2	GPa; MPa or N/mm^2; kPa			
Viscosity (dynamic)	Pa s	mPa s			poise; 1 P = 0.1 Pa s
Viscosity (kinematic)	m^2/s	mm^2/s			stokes; 1 St = 1 cm^2/s
Surface tension	N/m	mN/m			dyn/cm
Energy, work, heat	J (joule)	TJ, GJ, MJ, kJ, mJ	Electronvolt (eV) 1 eV ≈ 1.602 × 10^{-19} J		1 erg = 10^{-7} J 1 cal = 4.1868 J
Power	W (watt)	GW, MW, kW, mW, μW			
Temperature	K (kelvin), °C				1°K = 1 K
Thermal conductivity	W/mK				0.86 kcal/(m h grd)
Heat capacity	J/K	kJ/K			
Specific heat	J/(kg K)	kJ/(kg K)			
Entropy	J/K	kJ/K			
Amount of substance	mol (mole)				Mole
Electrical resistance	Ω				
Electrical conductivity	S (1/Ω)				

C. SI-PREFIXES

Factor	Prefix	Symbol	Factor	Prefix	Symbol
10^{18}	exa	E	10^{-1}	deci	d

A. INTRODUCTION

The decomposition of most organic free radical initiators follows first order kinetics. With certain peroxides, however, higher order decompositions are observed. Generally, the higher order reaction is caused by a reaction of radicals with the initiator (induced decomposition). The value of the rate for unimolecular decomposition may be determined either by extrapolation of the rate back to zero initiator concentration or by use of a monomer or other radical "trap". Some of the peroxides may also decompose by non-radical routes. Acids, bases, and polar solvents favor ionic intermediates. Koenig (296) presents an excellent discussion of azo and peroxide decomposition pathways.

Decomposition rate (k_d) data in these tables are reported for first order kinetics:

$$dL/dt = k_d L$$

where I is the initiator concentration (mol/l) and t is the time (s). The decomposition rate constant k_d is related to half-life ($t_{1/2}$) by the following equation:

$$t_{1/2} = 0.693/k_d$$

Fig. 1 relates k_d in s^{-1} to half-life for the range of k_d found in the tables.

For some of the initiators listed, the enthalpy (ΔH^*) is given (Note h) rather than the Arrhenius activation energy (E_a). The two quantities are related by the equation $E_a = \Delta H^* + RT$, where R is the gas constant (in kJ/mol-deg.) and T is the absolute temperature (94). Assuming that k_d is linear with respect to $1/T$ and that the activation energy, E_a, and the decomposition rate constant, k_d, for one temperature are known, k_d for any temperature can be calculated from the following expression:

$$\log k_2 = \log k_1 - \frac{E_a(T_2 - T_1)}{2.303R(T_2T_1)}$$

Where given by the author, the overall equation for k_d in terms of the frequency factor (A) and activation energy (E_a) has been included. Thus for any temperature (converted to K) the k_d may be calculated:

$$k_d = A\exp(-E_a/RT)$$

Although a wide range of initiators is reported in the tables, the author admits that the compilation is far from complete. There are several purposeful omissions: (a) azo compounds, where the azo group is part of a ring structure – these recombine almost exclusively; (b) compounds that decompose at appreciable rates only above 200 degrees. Neither class would be expected to be useful initiators. The data have been arranged into seven tables. Within each table the individual initiators are listed according to the following criteria:

1. Initiators:
   (a) according to increasing number of carbon atoms;
   (b) alphabetically (neglecting trivial prefixes), for compounds containing equal number of carbons;
   (c) miscellaneous initiators are listed alphabetically in Table 7.
2. For each initiator, solvents are listed alphabetically.
3. For a given solvent, all measurements reported by one investigator are listed in a series, with the activation energy listed opposite the lowest temperature.

Abbreviations: DMSO – dimethyl sulfoxide; DMAC – dimethylacetamide; DMF – dimethylformamide; THF – tetrahydrofuran; DCB – 1,2-dichlorobenzene.

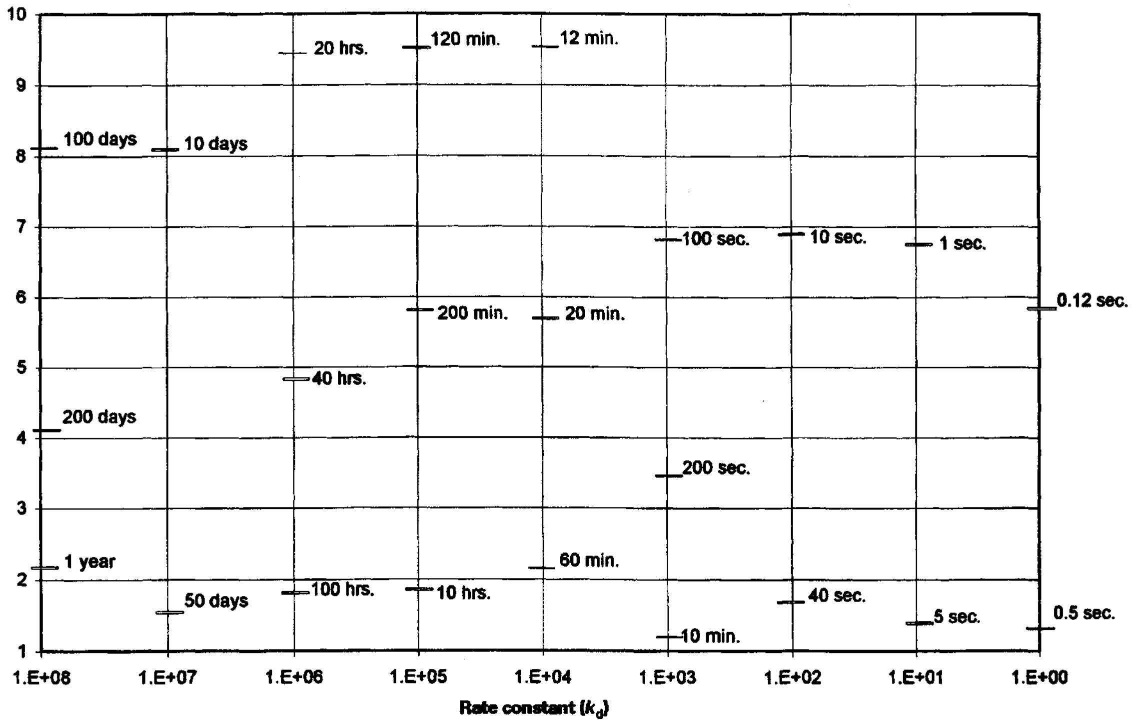

Figure 1. Relationship of half life to rate constant (k_d) (half lives are to the right of each vertical line)

C. NOTES

- a k_d converted to s^{-1} from author's units
- b k_d values for several concentrations averaged
- b_2 analyzed from nonisothermal conditions
- c k_d increases with increasing initiator concentration
- c_2 rate non-linear
- c_3 hydroperoxide concentration 7.83×10^{-3} mol/l
- c_4 hydroperoxide concentration 2.50×10^{-3} mol/l
- d k_d decreases with increasing initiator concentration
- d_2 after 1st half life; rate slower initially
- d_3 rate is second order: units are 1/mol sec.
- e k_d listed is for lowest initiator concentration
- f k_d is extrapolated value for zero initiator concentration
- g $k_d \neq$ has been corrected for induced decomposition
- g_2 corrected for uncatalysed reaction ($7 \times 10^{-5}\ s^{-1}$)
- h ΔH (not E_a)
- i pressure (number gives mbar)
- j iodometric analysis
- j_2 manometer measurement
- k infrared analysis
- l k_d is limiting value with respect to additive concentration
- m_1 3,4-dichlorostyrene added to minimize induced decomposition
- m_2 styrene added to minimize induced decomposition
- m_3 methyl methacrylate added to minimize induced decomposition
- m_4 isobutene added to minimize induced decomposition
- m_5 acenaphthalene added to minimize induced decomposition
- m_6 1 mol/l α-methylstyrene added to minimize induced decomposition
- m_7 butadiene added to minimize induced decomposition
- m_8 acrylonitrile added to minimize induced decomposition
- n trichloroacetic acid added
- n_2 3.2 wt.% or about 0.1 monolayer
- o addition of trichloroacetic acid did not affect k_d
- p degassed
- p_2 photochemical benzophenone added: 6.56×10^{17} quants/min @ 366 nm
- q addition of trichloroacetic acid increased k_d several fold
- q_2 pH 2.90
- q_3 pH 7.05
- r not inhibited, but initiator concentration low enough (0.01–0.09 M) so that higher order decomposition is unimportant
- s solvent not degassed
- t_1 2,6-di-*tert*-butylphenol added to inhibit induced decomposition
- t_2 α,α-diphenyl-β-picrylhydrazyl added to inhibit induced decomposition
- t_3 phenyl-α-naphthylamine added to inhibit induced decomposition
- t_4 tetrachloroquinone added to inhibit induced decomposition
- t_5 1,3,5-trinitrobenzene added to inhibit induced decomposition
- t_6 I_2 added to inhibit induced decomposition
- t_7 O_2 added to inhibit induced decomposition
- t_8 5–20% NO_2 added to inhibit decomposition

t_9 galvanoxyl added to inhibit induced decomposition
t_{10} α,γ-bisdiphenylene-β-phenylallyl added to inhibit induced decomposition
t_{11} α-naphthylamine added to minimize induced decomposition
t_{12} 2,3′,5′,6′-tetra-*tert*-butyl indophenoxy added
t_{13} benzoquinone added
t_{14} 2,6-di-*tert*-butyl-4-methylphenol added
u_1 in absence of oxygen
u_2 from initiation data
u_3 in multisurface reaction vessel
u_4 rate reduced when nujol layer used to exclude Hg vapor
u_5 rate increased when nujol layer used to exclude Hg vapor
v_1 acetic acid added
v_2 $CuCl_2$ added
v_3 CuCl added
v_4 0.1 mol $AgClO_4$/mol AIBN added
v_5 3.9 mol thiophenol added
v_6 *tert*-butyl mercaptan added
v_7 2.5 mol cyclohexane added
v_8 $\sim 4 \times 10^{-2}$ mol pyridine added
v_9 2×10^{-2} mol pyridine added
v_{10} 2.5 mol cumene added
v_{11} buffered with sodium pyrophosphate
v_{12} saturated with ethyl acetate
v_{13} 3.11 mol CCl_4 present
v_{14} peroxide in P(MMA)
v_{15} peroxide in P(sty.)
v_{16} 0.26 mol piperidine
v_{17} 0.24 mol triethylamine
v_{18} 0.21 mol *N,N*-diethylaniline
v_{19} 0.22 mol pyridine
v_{20} 0.9 mol $ZnCl_2$
v_{21} in presence of ^{15}NO
v_{22} 0.12 mol 18 crown 6 added
v_{23} 0.24 mol diglyme added
v_{24} 0.02 M pyridine added
v_{25} 0.10 M pyridine added
v_{26} 0.10 M 2,6-lutidine added
w stereoisomers
x_1 actual rate divided by 2 because of two identical peroxide groups
x_2 each peroxide group has different k_d
y measured in differential scanning calorimeter: subscript is heating rate in deg/min
z pressure (in bar)

A. INTRODUCTION

In free radical polymerization the propagation and termination rate constants describe the reactions

$$P_n^\bullet + M \xrightarrow{k_p} P_{n+1}^\bullet \quad \text{(A1)}$$

$$2P_n^\bullet \xrightarrow{k_t} \text{dead polymer} \quad \text{(A2)}$$

where $P_n^\bullet$ is a propagating chain of any length n and M is the monomer. The rate constants are defined by the following equations:

$$R_p = -\frac{d[M]}{dt} = k_p[P^\bullet][M] \quad \text{(A3)}$$

$$R_t = -\frac{d[P^\bullet]}{dt} = k_t[P^\bullet]^2 \quad \text{(A4)}$$

where

$$[P^\bullet] = \sum_{n=1}^{\infty}[P_n^\bullet] \quad \text{(A5)}$$

The rate constants k_p and k_t have usually been assumed to be independent of chain length. In this chapter termination constants depending on the length of the polymer radicals are also reported. In American literature the right hand side of (A4) is written as $2k_t[P^\bullet]^2$. In this chapter the definition given in Eq. (A4) has been used.

Simultaneous determination of absolute values of both k_p and k_t from a single experiment has not been reported. In practice, the ratio k_p^2/k_t is determined from measurements of molecular weight as a function of rate of polymerization for a low conversion polymerization or from measurements of initiation rate and polymerization rate in a low conversion. The ratio k_p/k_t is determined from nonsteady-state measurements of the average lifetime, τ, of the growing polymer chain in a photochemically initiated polymerization. This lifetime may be defined by noting that the concentration of chains present must be related to their average lifetime and rate of disappearance by

$$[P^\bullet]/\tau = R_t \quad \text{(A6)}$$

which, from (A3) and (A4), yields

$$\frac{k_p}{k_t} = \frac{\tau R_p}{[M]} \quad \text{(A7)}$$

By combining the separately determined ratios, k_p^2/k_t and k_p/k_t, the individual propagation and termination rate constants may be calculated. Alternatively, the rate of initiation, R_i, may be measured as the rate of initiator disappearance and equated to R_t. This gives (from (A6) and (A3))

$$k_p = \frac{R_p}{R_i\tau[M]} \quad \text{(A8)}$$

There is a large degree of imprecision inherent in measuring τ and in combining data from different experiments, which helps to explain the scatter in the data tabulated here.

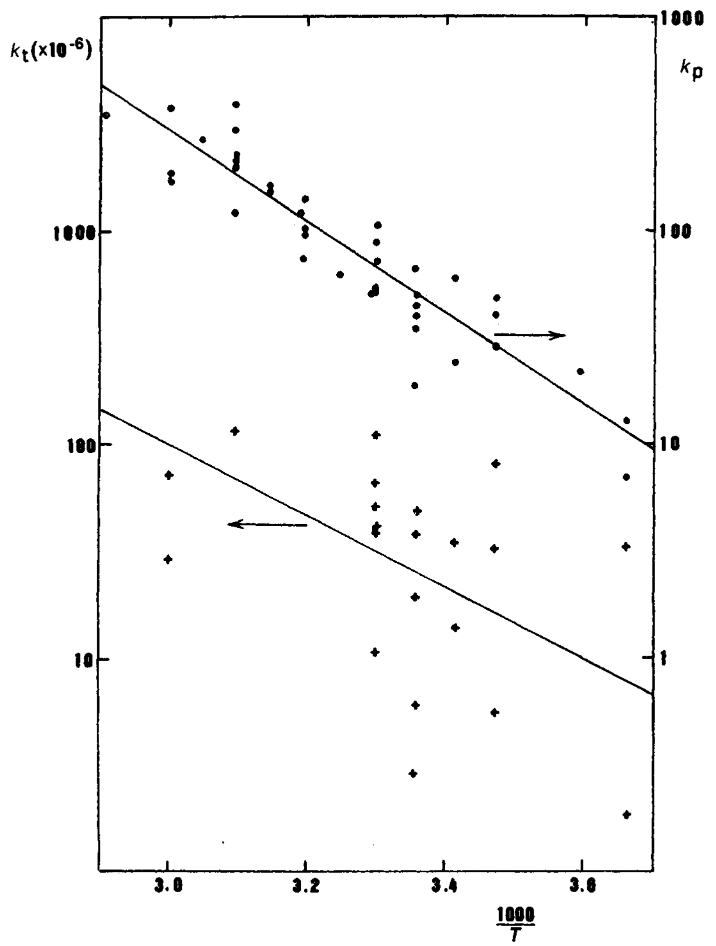

Figure 1. Arrhenius plots of all bulk polymerization data for styrene for k_p (•) and k_t (+). Solid lines are least squares obtained by assuming all points to be of equal value.

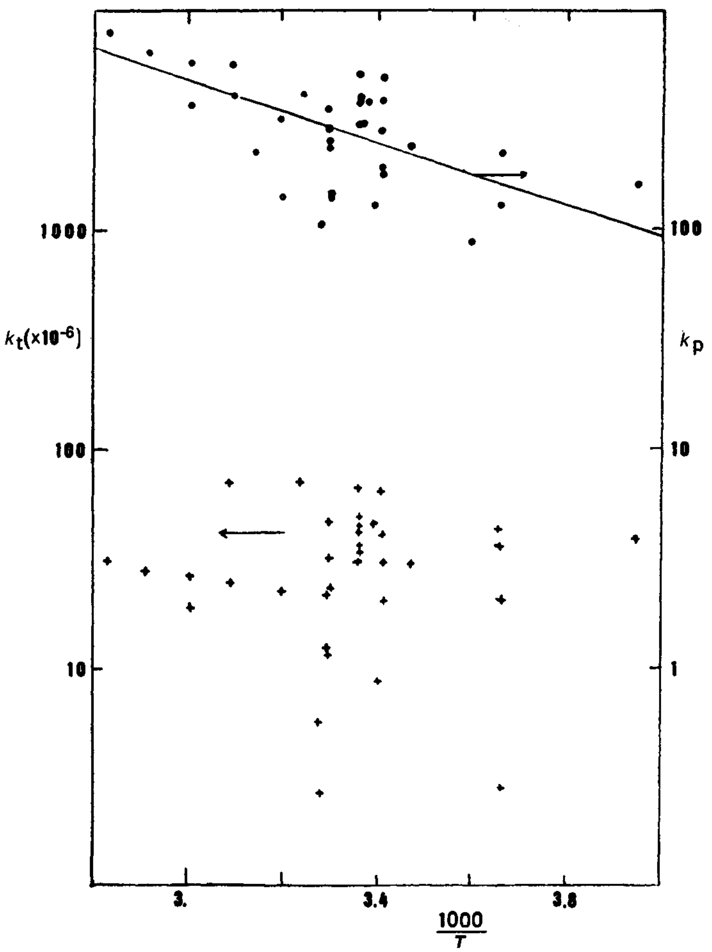

Figure 2. Arrhenius plots of all bulk polymerization data for methyl methacrylate for k_p (•) and k_t (+). Solid lines are least squares obtained by assuming all points to be of equal value. The line for k_t is not shown since a horizontal line for a temperature independent k_t could be a better representation.

The two monomers styrene and methyl methacrylate have been so extensively studied that their data are presented as Arrhenius plots (Figs. 1 and 2). Because of the influence of solvents on the rates, only data of bulk polymerizations are shown. It remains a wide scatter, which should serve as a warning against casual acceptance of any single number. Solid lines are the least squares that have been calculated assuming all points to be of equal value.

For the termination rate of methyl methacrylate the least-squares line results in a positive slope and is not shown. In this case a temperature-independent k_t could be a better representation of the experiments.

The pulse laser polymerization (PLP) method has been developed as a new method of obtaining k_p. In the PLP method, the value of k_p can be estimated from the degree of polymerization of polymer formed, ν_p, a knowledge of the monomer concentration, [M], and t_f the time between pulses:

$$\nu_p = k_p[M]t_f \qquad \text{(A9)}$$

The reproducibility of the PLP method has been recognized by an IUPAC Working Party on Modeling of Kinetic and Process of Polymerization, which is establishing a critical review of the literature values of k_p.

Classification of the methods for the determination of rate constants

The tabulated data refer to seven different methods.

Method A uses the following four methods for the measurement of the lifetime τ:

A1 – rotating sector or a "flashing" laser
A2 – flow through a tube with spatially separated light and dark sections
A3 – spacial intermittent polymerization (SIP)
A4 – intermittent illumination method

Method B effectively measures only a single decrease (increase), in the radical concentration by the following methods:

B1 – dilatometry
B2 – dielectric constant
B3 – interferomety
B4 – temperature change
B5 – viscosity
B6 – light scattering
B7 – monomer pressure

B8 – cathetometer
B9 – inhibitor
B10 – scavenger

Method C uses electron spin resonance (ESR) for the determination of the radical concentration

Method D refers to values obtained in emulsion polymerization by application of the Smith–Ewart theory

Method E refers to recalculated values

Method F uses pulse laser photopolymerization (PLP) method

F1 – PLP
F2 – PLP-GPC (MWD)
F3 – PLP-MALDI TOF (-GPC)

Method G refers to the method of measuring molecular weight (MW) and molecular weight distribution (MWD) by

G1 – gel permeation chromatography (GPC)
G2 – high performance liquid chromatography (HPLC)

A. INTRODUCTION

The transfer reaction in radical polymerization describes a process in which the polymer radical reacts with another molecule (monomer, polymer, catalyst, solvent, modifier, etc.) forming a dead polymer and new radical. This new radical can continue the kinetic chain:

$$P_n^{\bullet} + RX \xrightarrow{k_{tr,X}} P_nR + X^{\bullet}$$

$$X^{\bullet} + M \xrightarrow{k_{i,X}} P_1^{\bullet}$$

The dimensionless transfer constant is defined by the ratio

$$C_X = k_{tr,X}/k_p$$

where k_p is the rate constant of propagation.

† Based on the tables in the third edition, by K. C. Berger and G. Brandrup.

If it is assumed that

(a) all new radicals $X^{\bullet}$ react only by formation of growing polymer radicals;
(b) all polymer radicals have equal reactivities independent of their size;
(c) all rate constants are independent of solvent;
(d) the consumption of monomer by initiation and transfer is negligible compared with propagation;
(e) a steady-state concentration of polymer radicals is quickly established ($d[P^{\bullet}]/dt = 0$).

The application of these assumptions to the common reaction scheme results in the following relationship of ideal kinetics (Ref. 145):

$$\frac{1}{P_n} = \frac{1}{P_{n0}} + \sum C_X \frac{[X]}{[M]}$$

P_n, P_{n0} = number-average degree of polymerization obtained in the presence or absence, respectively, of transfer agent X.
[M], [X] = concentration of monomer or transfer agent, respectively.

The left-hand side of this equation is obtained by measuring the number average molecular weight of polymer at different concentrations of the transfer agent X, all other variables being kept constant. In many cases the degree of polymerization was determined by measurement of viscosity (Remark R). It should be noted that the ratio of

viscosimetric to number average molecular weight shows a considerable dependence on the molecular weight distribution.

The first term P_{n0} of the right-hand side of this equation is the number average molecular weight measured in the absence of transfer agent X. This is limited to cases where the transfer agent is a modifier. In all other cases, P_{n0} is calculated by combination of several kinetic expressions and used with its numerical value:

Initiation	$R_i = 2fk_d[I]$ or therm. $R_i = R_t$
Termination	$R_t = k_t[P^\bullet]^2 = (k_{t,d} + k_{t,c})[P^\bullet]^2$
Propagation	$R_p = k_p[M][P^\bullet]$
Number-average molecular weight	$P_{n0} = \dfrac{2(1+\delta)}{1+2\delta}\dfrac{R_p}{R_t}$

where k_t, $k_{t,d}$, and $k_{t,c}$ are the rate constants of termination, termination by disproportionation, and termination by combination, respectively.

$$\delta = k_{t,d}/k_{t,c}$$

The second term of the right-hand side of the above equation is given by the following expression:

$$C_X = C_M + C_I\frac{[I]}{[M]} + C_S\frac{[S]}{[M]} + C_p\frac{[P]}{[M]} + \cdots$$

where C_p is the constant of chain transfer with added polymer before starting polymerization.

The transfer constant of very reactive molecules can be determined from the rate of disappearance of both transfer agent and monomer:

$$C_X = \frac{d\ln([X])}{d\ln([M])}$$

This decrease of the transfer agent concentration with increasing monomer conversion is important in practice because very reactive transfer agents are used up preferentially, giving a broad molecular weight distribution if they cannot be replenished.

In analogy to quickly decomposing initiators with their criterion of "half-life", one can define, in addition to the transfer constant C_X, a "half-conversion" $U_{1/2}$ as that monomer conversion where the transfer agent is half consumed:

$$U_{1/2} = 100(1 - 0.5^{1/C_X})$$

The following table demonstrates (with some examples for a calibration curve) that the "half-conversion" $U_{1/2}$ decreases with increasing transfer constant C_X:

The "Half-Conversion" of Transfer Agents

C_X	$U_{1/2}(\%)$	C_X	$U_{1/2}(\%)$
0.1	99.9	5	13.0
0.2	96.8	10	6.7
0.5	75.0	20	3.4
1	50.0	50	1.4
2	29.3	100	0.7

The transfer agent must be replenished at this monomer conversion at the latest, if polymerization is to proceed, still yielding a narrow molecular weight distribution.

Numerous examples are known of polymerization systems that possibly do not satisfy basic assumptions: retardation (Remark J), induced decomposition and primary radical termination by peroxide or hydroperoxide initiation (Remarks C and B), diffusion control of termination (Remark X), electron donor/acceptor complexes (Remarks JJ), etc. Corresponding data in this table have to be used with caution.

B. TABLES OF TRANSFER CONSTANTS

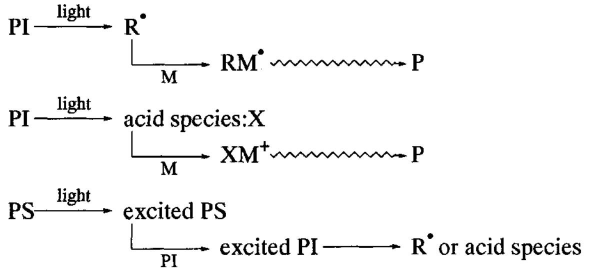
A. INTRODUCTION

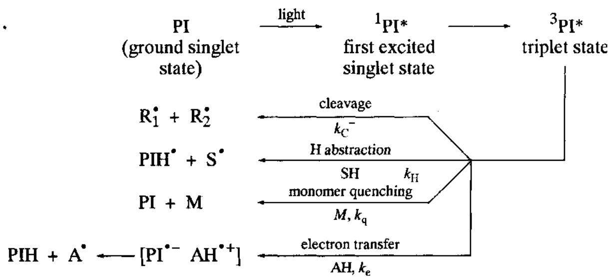
UV curing technologies use light beams to start photochemical and chemical reactions in organic materials (monomers, oligomers, prepolymers, polymers), mostly through a Photo-Induced Polymerization (PIP) reaction. This leads to the formation of a new polymeric material whose applications lie in various industrial sectors, such as coatings, graphic arts, imaging, microelectronics, etc. Specific advantages of these technologies over the usual thermal operations are rapid through-cure, solvent-free formulation, room temperature treatment and low energy requirements.

This PIP process is concerned with the creation of a polymer P through a chain radical or cationic reaction initiated by light in the presence of a photoinitiator (PI) and a coupled PI/photosensitizer (PS):



The reactivities of PI and PS govern, for a large part, the practical efficiency of the PIP reaction. The present chapter reports typical data obtained (through time-resolved laser spectroscopy experiments) on the excited state processes in PI and PS occurring after the absorption of the photon. Rate constants reported in the following tables correspond to the following processes:

1.



2. $R^{\bullet}$ (or $A^{\bullet}$ or $S^{\bullet}$...) + M $\xrightarrow{k_{RM}}$ $RM^{\bullet}$
3. $^3PI^*$ + light stabilizer (LS) $\xrightarrow{k_a}$
4. $^3PS^*$ + PI $\xrightarrow{k_T}$ excitation transfer
5. τ_T°: Triplet state lifetime under the given conditions (equal to the reciprocal value of the sum of the first-order rate constants of the different processes)
   τ_T: Triplet state lifetime in the presence of a given additive
6. $^3PS^*$ + cationic photoinitiator C^+ $\xrightarrow{k_e}$ $PS^{\bullet +}$ $C^{\bullet}$
   (a) Energy transfer can sometimes occur:
   $^3PS^* + C^+ \longrightarrow PS + C^{+*}$
   (b) Energy and electron transfer can also occur in the first excited singlet state $^1PS^*$.

Detailed data are available, especially in several chapters of two edited books (1) and in a recent monograph (2). Few data are known on the photopolymerization itself and largely depend on the practical formulation used as well as the experimental conditions. Typically, one photon absorbed can lead to ~10000 polymerized double bonds (3). Rate constants of propagation k_p and termination k_t for a polyurethane acrylate resin containing an acrylate monomer (weight ratio, 1 : 1) as reactive diluent are $\sim 10^4$ l/mol/s and 3×10^4 l/mol/s respectively (when half of the double bonds have been polymerized) (3).

C. References II-290

A. INTRODUCTION

When a vinyl monomer is copolymerized with a second monomer, the relationship between the composition of the initially formed copolymer and the initial monomer mixture is given by

$$\frac{dm_1}{dm_2} = \frac{M_1(r_1M_1 + M_2)}{M_2(r_2M_2 + M_1)}$$

where m_1 is the number of moles of monomer 1 entering the copolymer, m_2, the number of moles of monomer 2 entering the copolymer, M_1, the number of moles of monomer 1 in the monomeric mixture, M_2, the number of the moles of monomer 2 in the monomer mixture, and r_1 and r_2 are the monomer reactivity ratios.

The monomer reactivity ratios, r_1 and r_2, for any monomer pair are the ratios of the rate constants of the different propagation reactions:

$$\sim M_1^{\bullet} + M_1 \longrightarrow \sim M_1M_1^{\bullet} \quad k_{11}$$
$$\sim M_1^{\bullet} + M_2 \longrightarrow \sim M_1M_2^{\bullet} \quad k_{12}$$
$$\sim M_2^{\bullet} + M_2 \longrightarrow \sim M_2M_2^{\bullet} \quad k_{22}$$
$$\sim M_2^{\bullet} + M_1 \longrightarrow \sim M_2M_1^{\bullet} \quad k_{21}$$

with $r_1 = k_{11}/k_{12}$, $r_2 = k_{22}/k_{21}$. $\sim M^{\bullet}$ represents a polymer chain ending in a radical derived from monomer M.

The original compilations of reactivity ratios and their references were published by L. J. Young in the first two editions of this Handbook. In the third edition, the original listings and those through 1986 were re-evaluated. This fourth edition contains an additional 548 evaluated monomer pairs giving a total of 3,265 such pairs. Only free radical reactivity ratios are listed. When the original references were available, they were read. If the experimental data was published, the reactivity ratios were recalculated according to the methods of Kelen and Tűdös (803,804). The 95% confidence limits for the reactivity ratios were also calculated (805). If the authors used this method for *r*-value evaluation, including adjustment of the monomer feeds for total conversion, then the reported values were utilized. There are a number of reported reactivity ratios that are not reported here. This is due to the absence of these values in the abstracts of papers which were published in journals unavailable to the author.

All of the monomer pairs in Table 1 are cross-referenced. The full spelling of each monomer was included in its Monomer 1 citation. Sometimes truncated but distinguishable names have been used in the Monomer 2 lists.

If only the reactivity ratios and reference are given, then, either no experimental data was given or the journal was not available and the Chemical Abstracts summary was the source of the data. If a Y or N (yes or no) appears in the conversion (Conv.) column then the reactivity ratios were recalculated. If a recalculation was performed but the 95% confidence columns (95%) are still left blank, it indicates that only two feed/polymer data pairs were available. In general, if there is a citation (Y or N) in the Conv. column but no reactivity ratios are shown in the reactivity ratio columns, the copolymerization did not follow the copolymerization equation (ionic or penultimate effects were prevalent). In a few cases, the data were too scattered to allow a reactivity ratio calculation.

Recalculations yield negative reactivity ratios in several cases. We are aware that this is a physically unrealistic artifact. When the 95% confidence limits are applied to these negative numbers, a value of zero usually falls within these limits. It may be noted that a single reference sometimes contains a variety of reactivity ratios for one monomer pair. The reader may assume that these result from a change of polymerization conditions; e.g., different polymerization temperatures or polymerization media of varying polarity.

For those who are interested in using the Kelen–Tűdös calculations, a listing of a simplistic program written in QuickBasic (Microsoft) is also given (Table 2).

*Retired.

Table 3. Monomers Arranged by Q Values II-314
Table 4. Monomers Arranged by e Values II-317
C. References II-319

A. INTRODUCTION

The Alfrey and Price Q and e equation (A1) is well known:

$$Q_2 = (Q_1/r_1)\exp\{-e_1(e_1 - e_2)\} \qquad \text{(A1)}$$

Q and e are measures of the reactivity and polarity, respectively, of a vinyl monomer and $r_1 = k_{11}/k_{12}$, a reactivity ratio. This equation may be arranged to a logarithmic form (A2) which provides a more convenient linear solution:

$$\{[\ln(Q_1/r_1)] - e_1^2\} = -e_2e_1 + \ln Q_2. \qquad \text{(A2)}$$

When monomer 2 is the one to be characterized, its Q and e values may be determined from the slope ($-e_2$) and intercept ($\ln Q_2$) of the equation.

The first requirement for the use of Eq. (A2) is the selection of a small group of common monomers for which Q and e could be independently established. Since, by definition the Q and e scheme is based on styrene ($Q = 1.0$ and $e = -0.8$), the average Q and e values of these primary monomers were calculated using Eqs. (A1) and (A3) (Ref. 1).

$$e_2 = e_1 \pm (-\ln r_1r_2)^{1/2} \qquad \text{(A3)}$$

utilizing only their reactivity ratios with styrene. The six primary monomers (Group I) – acrylic acid, acrylonitrile, butadiene, methyl acrylate, methacrylonitrile and methyl methacrylate – were chosen because their reactivity ratios had been narrowly defined by several investigators. These primary reactivity ratios were taken from the compilation in the second edition of this Handbook.

The Q and e values of a secondary group (Group II) of ten common vinyl monomers were determined using Eq. (A2), with the primary monomer group supplying the Q_1 and e_1 values. The Q and e values were then calculated for a tertiary set (Group III) of reactivity ratios for which a set of reactivity ratios with four or more of the primary and secondary monomers was available. For all groups except Group I, recalculated reactivity ratios (see the preceding chapter) were used when available. Otherwise, reported values were included.

The Q and e values developed for the three groups during the first pass through the data were subsequently used to recalculate the Q and e values for Groups II and III. Group I was not redetermined so that the styrene bias of the system could be better maintained. After four iterations, no significant changes were observed. During the iterative process, a number of reactivity ratio citations were dropped due to a lack of fit with the majority of data points.

The final Q and e values for these three groups were then used to determine the Q and e values of other monomers with four or more reactivity ratio citations with at least three comonomers (Group IV), and monomers with three citations with three different comonomers (Group V).

By replacing r_1 in Eq. (A2) with the reciprocal of the chain transfer constant, $1/C_s$ (3), Q and e values of telogens may also be estimated (4) from their coreactivity with vinyl monomers.

The Monomer Table lists the monomer group designation, the Q and e values, and the correlation coefficient (r) for the regression. The Number column (n) represents the number of r_1 values actually used in the regression. If the monomer is in Group V, the number is understood to be 3. The data are listed alphabetically as well as in increasing values of Q and e.

*Retired.

Recent work by Jenkins (5) has uncovered another approach to characterizing the copolymerization character of vinyl monomers. By deriving data from r_1 and r_2 values, he was able to calculate three coefficients which appear to allow a more precise prediction of the actual reactivity ratios.

B. *Q* AND *e* VALUES FOR FREE RADICAL COPOLYMERIZATIONS

TABLE 1. MONOMERS

Monomer	Group	*Q*	*e*	*n*	*r*
Acenaphthalene	IV	0.72	− 1.88	5	0.98
Acetylene, phenyl-	IV	0.45	0.10	6	0.75
Aconitate, trimethyl	III	0.25	2.27	5	0.63
Acrolein	IV	0.80	1.31	16	0.97

A. INTRODUCTION

The relation between monomer reactivity ratios and the Alfrey–Price Q–e parameters is explained in the introduction to the tables of monomer reactivity ratios and Q–e values, compiled by Robert Z. Greenley and published in the present volume (1,2). Although very widely used, the Q–e scheme is well known to have serious limitations (3), which have prompted several attempts to improve upon it. One such endeavour was the "Patterns of Reactivity" scheme, first described as long ago as 1959 (4–7), when the Q–e scheme was only about ten years old; despite the indisputably more satisfactory basis of this procedure, it did not achieve popularity but recent revisions have greatly improved both its accessibility and its accuracy (3,8,9).

In the Q–e scheme, four parameters (Q_1, Q_2, e_1, e_2; two for each monomer) are necessary for the prediction of a monomer reactivity ratio (e.g. $r_{12} = k_{11}/k_{12}$, where subscript 1 refers to the radical and subscript 2 to the monomer) but the same four parameters also facilitate the prediction of the partner monomer reactivity ratio ($r_{21} = k_{22}/k_{21}$) because identical Q and e parameters are used to characterise both a given monomer and its derived radical. This device is certainly economical on input data but it introduces an approximation of very doubtful validity.

In the "Patterns" scheme (to use the abbreviated title), different parameters are designated for the monomer and its conjugate radical. Hence, while four input parameters are again necessary for the calculation of a single monomer reactivity ratio, eight are required to calculate both r_{12} and r_{21}. The reward for the greater input of data is a substantial increase in the precision of the result; furthermore, all four parameters for each monomer/radical conjugate pair are experimentally determined from polymerization data, specifically monomer reactivity ratios from Greenley's tabulation, so no arbitrary assignment is involved, as it is with the Q–e scheme.

The fundamental equation for the calculation of a reactivity ratio, r_{12}, is given below.

$$\log r_{12} = \log r_{1S} - u_2\pi_1 - v_2. \qquad \text{(A1)}$$

Here, the symbol S denotes the monomer styrene, and $\log r_{1S}$ is the counterpart of Q_1 in the Q–e scheme. The counterpart of e_1 is the polarity parameter π_1; this is usually almost exactly equal to the Hammett σ parameter for the substituent(s) present on the α-carbon atom of the radical derived from monomer 1 but it is best calculated (8) from monomer reactivity ratio data according to Eq. (A2).

$$\pi_1 = 0.385 \log[(r_{1A})/0.377(r_{1S})] \qquad \text{(A2)}$$

Here, the symbol A denotes the monomer acrylonitrile. It is truly an astonishing fact that the Hammett σ parameter, derived originally from studies of the dissociation of substituted benzoic acids, is equal in value to a simple quantity derived from a knowledge of the monomer reactivity ratios for the reactions of a monomer 1 with (separately) acrylonitrile and styrene.

The values of u_2 and v_2, the respective counterparts of the Q–e scheme's e_2 and Q_2, are determined by reference to data for the (separate) copolymerizations of monomer 2 with the members of a Basic Monomer Set. These are five monomers for which reliable data exist in the literature: styrene (S); methyl methacrylate (MM); methyl acrylate

(MA); methacrylonitrile (MAN); and acrylonitrile (A). Ideally, monomer reactivity ratios should be known for the copolymerization of the monomer of interest (labelled 2 in this case) with each of these five reference monomers. If the reference monomer is monomer 1 in this context, a plot is made of $[\log r_{12} - \log r_{1S}]$ against π_1; the slope of the resulting straight line is $-u_2$ and the intercept on the ordinate axis is $-v_2$, in conformity with Eq. (A1).

If data for reactions with all five members of the Basic Monomer Set are not available, use can be made of such data as exists, always provided that styrene and acrylonitrile are among the monomers included. This condition ensures that the data are spread over a wide range of radical polarity, represented by π_1, because styrene has a very low value (zero), while acrylonitrile has one of the highest values known (0.701).

In Table 1, each monomer is designated either as Basic or assigned to a category according to the number of members of the Basic Monomer Set for which data have been employed in the determination of its u_2 and v_2; for category 5, all five Basic monomers were involved, and so on down to category 2, where data for only styrene and acrylonitrile are available. Clearly, the higher the category number, the more reliable the u_2 and v_2 values. The procedure described thus far is known as the *Patterns U,V Scheme* (3).

For Group 2 monomers, there is no need to make a plot because the use of just two data points permits algebraic solutions to be found. In fact, it can be shown (3) that the following relations hold.

$$u_2 = [\log r_{AS} - \log r_{A2} + \log r_{S2}]/\pi_A \quad \text{and} \quad v_2 = -\log r_{S2} \tag{A3}$$

Substitution in Eq. (A1) leads to the following relationships (A4, A5), giving the two monomer reactivity ratios for the copolymerization of any two monomers, 1 and 2.

$$\log(r_{12}) = \log[(r_{1S})(r_{S2})] - \frac{\{\log[(r_{AS})(r_{S2})/(r_{A2})]\}\{\log[(r_{SA})(r_{1S})/(r_{1A})]\}}{\log[(r_{AS})(r_{SA})]} \tag{A4}$$

$$\log(r_{21}) = \log[(r_{2S})(r_{S1})] - \frac{\{\log[(r_{AS})(r_{S1})/(r_{A1})]\}\{\log[(r_{SA})(r_{2S})/(r_{2A})]\}}{\log[(r_{AS})(r_{SA})]} \tag{A5}$$

Application of Eqs. (A3–A5) corresponds to the *Patterns A,S Scheme* (4), so-called, because data for reaction with only acrylonitrile and styrene are involved. According to the Patterns A,S Scheme, it is possible to calculate the two monomer reactivity ratios for copolymerization of monomers 1 and 2, if each of them has separately been copolymerized with acrylonitrile and styrene. (The two monomer reactivity ratios for copolymerization of acrylonitrile and styrene are also required. These are taken to be: $r_{AS} = 0.04$, $r_{SA} = 0.38$ (3).)

The π, u, and v values listed in the table below have been derived as explained above, with the Patterns U,V Scheme being used for the monomers in categories 3–5 and the Patterns A,S Scheme for those in category 2. The r_{1S} values are mean values from the figures supplied in Greenley's table, making due allowance for the consistency of the data.

B. EXAMPLE

Suppose one wants to evaluate the monomer reactivity ratios for the copolymerization of 2-chlorobutadiene (CB) and 2-vinylpyridine (VP). To use the Patterns U,V Scheme for this purpose, it is first necessary to consult Greenley's table of monomer reactivity ratios for data characterizing the copolymerizations of each of these monomers with as many members of the Basic Monomer Set as possible. In fact, in both cases, values exist for reactions with styrene, methyl methacrylate, methyl acrylate and acrylonitrile, but not methacrylonitrile. The π values for the four useful basic monomers are, respectively, 0.000, 0.339, 0.423 and 0.701. The relevant monomer reactivity ratios are listed in the table below.

MONOMER REACTIVITY RATIOS FOR 2-CHLOROBUTADIENE AND 2-VINYLPYRIDINE AND MEMBERS OF THE BASIC MONOMER SET

Monomer reactivity ratio	2-Chlorobutadiene	2-Vinylpyridine
$r_{X,S}$	6.91	1.26
$r_{X,A}$	5.18	0.44
$r_{S,X}$	0.038	0.53
$r_{A,X}$	0.05	0.10
$r_{MM,X}$	0.08	0.35
$r_{MA,X}$	0.06	0.25

X = 2-chlorobutadiene or 2-vinylpyridine.

Plots of $[\log r_{12} - \log r_{1S}]$ against π_1, where 2 = CB or VP, are linear with slopes and intercepts that provide the following u and v values (9). For CB, $u = -2.18$, $v = 1.44$, and for VP, $u = -0.982$ and $v = 0.323$. All the data are now available for substitution in Eq. (A1), first for CB = monomer 1 and VP = monomer 2, and secondly with the monomers' roles reversed, to obtain values of r_{12} and r_{21}. The results are $r_{12} = 4.26$ and $r_{21} = 0.04$. The Patterns A,S Scheme can be applied by simply substituting the appropriate monomer reactivity ratio data in Eqs. (A4) and (A5), giving $r_{12} = 4.71$ and $r_{21} = 0.05$. The corresponding experimental results are $r_{12} = 5.19$ and $r_{21} = 0.06$, while the $Q = e$ scheme predicts that $r_{12} = 1.07$ and $r_{21} = 0.07$.

C. TRANSFER CONSTANTS

Transfer constants can be predicted by exactly parallel reasoning (3). It is necessary only to realise that whereas the rate constant for the propagation step of a radical with its own parent monomer appears in the *numerator* of a monomer reactivity ratio ($r_{12} = k_{11}/k_{12}$), where both rate

constants refer to propagation reactions, it figures in the *denominator* of a transfer constant because $(C_2)_1 = k_{12}/k_{11}$, where k_{12} represents a transfer reaction between the radical derived from a monomer (species 1) and a transfer agent (species 2); the equations for calculating transfer constants are thus easily obtained from the equations above by replacing $\log r_{12}$ by $-\log(C_2)_1$. The only formal difference between the two cases is that, for transfer, there is no symmetrical counterpart of the equations representing reaction of a radical of type 2 with a transfer agent of type 1. Thus, the equivalent of Eq. (A1), for transfer is Eq. (A6), and this enables the Patterns U,V Scheme to be applied to chain transfer.

$$-\log(C_2)_1 = \log r_{1S} - u_2\pi_1 - v_2 \qquad \text{(A6)}$$

For use of the Patterns A,S Scheme in transfer, a parallel derivation to that used in copolymerization leads to the following equation, where $(C_2)_S$ and $(C_2)_A$ are, respectively, the (known) transfer constants for reaction of the same transfer agent (species 2) with radicals derived from styrene and acrylonitrile (species 1).

$$\log(C_2)_1 = \log[(C_2)_S/r_{1S}] + (\pi_1/\pi_A)\log[r_{AS}(C_2)_A/(C_2)_S] \qquad \text{(A7)}$$

Since $\pi_A = 0.701$ and $r_{AS} = 0.04$, this equation can be reduced to Eq. (A8) for general use.

$$\log(C_2)_1 = \log[(C_2)_S/r_{1S}] + (1.43\pi_1)\log[0.04(C_2)_A/(C_2)_S] \qquad \text{(A8)}$$

The transfer constants used here are taken from two tabulations, one due to Eastmond (10) and one in the *Polymer Handbook* (11).

D. TABLES OF PARAMETERS

As explained above, each monomer or transfer agent is assigned to a category, designated by Basic or the number 2, 3, 4, or 5, according to the number of members of the Basic Monomer Set with which this reagent has been reacted to obtain data for the evaluation of u, v and (in the case of monomers) π. Although it must be true that the higher the category, the more reliable the derived parameters, the difference between Categories 2 and 5 is not so great as might appear at first sight. In *all* cases, two of the basic monomers involved are styrene, S, (the least polar) and acrylonitrile, A, (the most polar), so the role played by other basic monomers is merely to add intermediate points to what should be a straight line joining the data points for S and A; if the data for these two latter monomers are accurate, intermediate points add little or no value beyond confirmation of the slope and intercept. They do contribute valuable weighting when there are some discrepancies in the data, but parameters have not been recorded here in cases where the discrepancies are large.

Where *either* r_{1S} *or* r_{1A} was reported as zero, the value 0.05 has been assigned arbitrarily in order to make it possible to calculate an approximate value for the π parameter but the values of the u and v parameters are not influenced by this device; entries of this type are printed in italics in Table 1. Sometimes both r_{1S} *and* r_{1A} are reported to be zero; when this happens, π cannot usefully be estimated but u and v can still be determined, if positive values of r_{S1} and r_{A1} are available.

Nomenclature In the tables below, compounds are listed in alphabetical sequence in accordance with the following rules:

The primary listing is based on the root name of the compound and the secondary sequence on the name(s) of the substituent(s) or the esterifying moiety. For example, the compounds, *p*-methyl styrene, *N*-vinyl carbazole, and ethyl acrylate, will be found listed under Styrene, *p*-methyl, Carbazole, *N*-vinyl, and Acrylate, ethyl, respectively.

In deciding on the appropriate order of names, *all prefixes (alphanumeric, Greek or whatever) and spaces* are ignored, and reliance is placed solely on the alphabetical priority of the strictly chemical part of the name. In styrene, *p*-methyl, for example, the prefix *p*- plays no part in determining the place of this name in the list; this is governed by the *m* in methyl.

TABLE 1. MONOMERS

Monomer	Category	r_{1S}	r_{1A}	r_{A1}	r_{S1}	$\log(r_{1S})$	π	u	v

A. INTRODUCTION

In contrast to radical and ionic polymerization reactions in which the incoming monomer always adds to the *end* of the growing chain

$$\text{R–M}_n\text{–M}_{n+1}\text{–M}_{n+2}\text{–M}_{n+3}\text{–M}_{n+4}^{\bullet}$$

the most distinct feature of Ziegler–Natta-catalysis is the attachment of a monomer molecule to a highly structured catalyst complex (which may be homogeneously solvated or heterogeneously fixed to a surface) and its insertion *between* the catalyst complex and the growing chain:

$$\text{R–M}_{n+4}\text{–M}_{n+3}\text{–M}_{n+2}\text{–M}_{n+1}\text{–M}_n$$

Since the structural features of the catalyst – in particular the steric bulk of ligands, the bite angle of metallocenes, the configuration and conformation on the one hand, and the increasing space-filling demand of the growing chain and of the various monomers on the other – do influence the addition of the monomers, elucidation of the copolymerization behavior, and, in particular, determination of copolymerization parameters requires correct modeling, i.e. adequate Markov-statistics.

B. A BRIEF THEORETICAL OUTLINE OF COPOLYMERIZATION REACTIONS

Various mathematical models have been applied to copolymerization reactions induced by Ziegler–catalysts. Wall (1) assumed the velocity of the monomer addition M_1 and M_2 to be independent of the previously integrated monomeric unit (zero-order Markov model):

$$\text{R–Kat} + \text{M}_1 \xrightarrow{k_1} \text{R–M}_1\text{–Kat}$$

$$\text{R–Kat} + \text{M}_2 \xrightarrow{k_2} \text{R–M}_2\text{–Kat}$$

$$\text{R} = \text{Polymer chain}$$

This scheme gives rise to the following equation for a copolymerization reaction:

$$\frac{d[\text{M}_1]}{d[\text{M}_2]} = r\frac{[\text{M}_1]}{[\text{M}_2]} \qquad r = \frac{k_1}{k_2}$$

Mayo and Lewis (2) extended this model by including the influence of the last built-in monomer into the chain during the subsequent step (first-order Markov model):

$$\text{R–M}_1\text{–Kat} + \text{M}_1 \xrightarrow{k_{11}} \text{R–M}_1\text{–M}_1\text{–Kat}$$

$$\text{R–M}_1\text{–Kat} + \text{M}_2 \xrightarrow{k_{12}} \text{R–M}_1\text{–M}_2\text{–Kat}$$

$$\text{R–M}_2\text{–Kat} + \text{M}_1 \xrightarrow{k_{21}} \text{R–M}_2\text{–M}_1\text{–Kat}$$

$$\text{R–M}_2\text{–Kat} + \text{M}_2 \xrightarrow{k_{22}} \text{R–M}_2\text{–M}_2\text{–Kat}$$

This results in the so-called Mayo–Lewis equation,

$$\frac{d[\text{M}_2]}{d[\text{M}_1]} = \frac{[\text{M}_2]\, r_2([\text{M}_2]/[\text{M}_1]) + 1}{[\text{M}_1]\,([\text{M}_2]/[\text{M}_1]) + r_1}$$

with $r_1 = k_{11}/k_{12}$ and $r_2 = k_{22}/k_{21}$. Taking the effect of

the last *two* built-in monomers into account, Merz, *et al.* (3) developed a second-order Markov model. This 'penultimate model' necessarily results in a more complex kinetic scheme:

$$\text{R-M}_1\text{-M}_1\text{-Kat} + \text{M}_1 \xrightarrow{k_{111}} \text{R-M}_1\text{-M}_1\text{-M}_1\text{-Kat}$$
$$\text{R-M}_1\text{-M}_1\text{-Kat} + \text{M}_2 \xrightarrow{k_{112}} \text{R-M}_1\text{-M}_1\text{-M}_2\text{-Kat}$$
$$\text{R-M}_2\text{-M}_1\text{-Kat} + \text{M}_1 \xrightarrow{k_{211}} \text{R-M}_2\text{-M}_1\text{-M}_1\text{-Kat}$$
$$\text{R-M}_2\text{-M}_1\text{-Kat} + \text{M}_2 \xrightarrow{k_{212}} \text{R-M}_2\text{-M}_1\text{-M}_2\text{-Kat}$$
$$\text{R-M}_1\text{-M}_2\text{-Kat} + \text{M}_1 \xrightarrow{k_{121}} \text{R-M}_1\text{-M}_2\text{-M}_1\text{-Kat}$$
$$\text{R-M}_1\text{-M}_2\text{-Kat} + \text{M}_2 \xrightarrow{k_{122}} \text{R-M}_1\text{-M}_2\text{-M}_2\text{-Kat}$$
$$\text{R-M}_2\text{-M}_2\text{-Kat} + \text{M}_1 \xrightarrow{k_{221}} \text{R-M}_2\text{-M}_2\text{-M}_1\text{-Kat}$$
$$\text{R-M}_2\text{-M}_2\text{-Kat} + \text{M}_2 \xrightarrow{k_{222}} \text{R-M}_2\text{-M}_2\text{-M}_2\text{-Kat}$$

With $r_{11} = k_{111}/k_{112}$, $r_{21} = k_{211}/k_{212}$, $r_{22} = k_{222}/k_{221}$ and $r_{12} = k_{122}/k_{121}$, the following copolymerization equation is obtained:

$$\frac{d[\text{M}_1]}{d[M_2]} = \frac{1 + r_{21}x(1 + r_{11}x)/(1 + r_{21}x)}{1 + (r_{12}/x)(1 + r_{22}/x)/(1 + r_{12}/x)}$$

with $x = [\text{M}_1]/[\text{M}_2]$.

Expanding this model even further to the influence of the last *three* monomeric units, Ham (4) proposed a third-order Markov model. However, due to the many parameters involved, it has been of little practical use.

Thus, most authors restrict themselves to first- or second-order Markov models when dealing with Ziegler–Natta-catalysis for copolymerization, and this is elaborated below.

1. First-Order Markov Model

The Mayo–Lewis equation describes the composition of a copolymer as a function of the composition of the monomer mixture and their respective copolymerization parameters. These parameters not only determine the composition of the resulting copolymer, but also its microstructure, e.g. the distribution of the sequence length.

A knowledge of the ratio of the starting monomers and their copolymerization parameters enables the sequence length distribution to be calculated. The reactivity probabilities P_{ij} are defined (5,6) that give the probability of the monomer j adding to the polymer chain with the terminating monomer i:

$$P_{11} = \frac{k_{11}[\text{R-M}_1\text{-Kat}][\text{M}_1]}{k_{11}[\text{R-M}_1\text{-Kat}][\text{M}_1] + k_{12}[\text{R-M}_1\text{-Kat}][M_2]} = \frac{r_1}{r_1 + [\text{M}_2]/[\text{M}_1]}$$

$$P_{12} = \frac{k_{12}[\text{R-M}_1\text{-Kat}][\text{M}_2]}{k_{11}[\text{R-M}_1\text{-Kat}][\text{M}_1] + k_{12}[\text{R-M}_1\text{-Kat}][M_2]} = \frac{1}{r_1[\text{M}_1]/[\text{M}_2] + 1}$$

$$P_{21} = \frac{k_{21}[\text{R-M}_2\text{-Kat}][\text{M}_1]}{k_{21}[\text{R-M}_2\text{-Kat}][\text{M}_1] + k_{22}[\text{R-M}_2\text{-Kat}][M_2]} = \frac{1}{1 + r_2[\text{M}_2]/[\text{M}_1]}$$

$$P_{22} = \frac{k_{22}[\text{R-M}_2\text{-Kat}][\text{M}_2]}{k_{21}[\text{R-M}_2\text{-Kat}][\text{M}_1] + k_{22}[\text{R-M}_2\text{-Kat}][M_2]} = \frac{r_2}{[\text{M}_1]/[\text{M}_2] + r_2}$$

with $P_{11} + P_{12} = 1$ and $P_{21} + P_{22} = 1$

The proportion of the M_1 and M_2 units (${}^1P_1$ or ${}^1P_2$) in the copolymer is also determined by reactivity probabilities:

$${}^1P_1 = {}^1P_1P_{11} + {}^1P_2P_{21}$$
$${}^1P_2 = {}^1P_1P_{12} + {}^1P_2P_{22}$$

giving ${}^1P_1 = P_{21}/(P_{12} + P_{21})$ and ${}^1P_2 = P_{12}/(P_{12} + P_{21})$.

All the potential sequence distributions can thus be calculated. Consider, for example, the triad distributions:

$$\text{M}_1\text{M}_1\text{M}_1 = {}^1P_1P_{11}P_{11} = [P_{21}(1 - P_{12})^2]/[P_{12} + P_{21}]$$
$$\text{M}_1\text{M}_1\text{M}_2 + \text{M}_2\text{M}_1\text{M}_1 = 2\,{}^1P_1P_{11}P_{12} = 2[P_{21}(1 - P_{12})P_{12}]/[P_{12} + P_{21}]$$
$$\text{M}_2\text{M}_1\text{M}_2 = {}^1P_2P_{21}P_{12} = [P_{12}^2P_{21}]/[P_{12} + P_{21}]$$
$$\text{M}_2\text{M}_2\text{M}_2 = {}^1P_2P_{22}P_{22} = [P_{12}(1 - P_{21})^2]/[P_{12} + P_{21}]$$
$$\text{M}_2\text{M}_2\text{M}_1 + \text{M}_1\text{M}_2\text{M}_2 = 2\,{}^1P_1P_{12}P_{22} = 2[P_{21}P_{12}(1 - P_{21})]/[P_{12} + P_{21}]$$
$$\text{M}_1\text{M}_2\text{M}_1 = {}^1P_1P_{12}P_{21} = [P_{21}^2P_{12}]/[P_{12} + P_{21}]$$

The triad distribution allows the calculation of the true copolymerization parameters. For a given polymer, the triad distribution is deduced from experimental ^{13}C-NMR spectra (7) (see below).

2. Second-Order Markov Model

The kinetic scheme for this model gives rise to eight reaction probabilities P_{ijk} that result from the probability of the monomer k adding to the polymer chain with the terminating monomers ij. The reactivity probability P_{121} is

given for instance as

$$P_{121} = \frac{k_{121}[\text{R-M}_1\text{-M}_2\text{-Kat}][\text{M}_1]}{k_{121}[\text{R-M}_1\text{-M}_2\text{-Kat}][\text{M}_1] + k_{122}[\text{R-M}_1\text{-M}_2\text{-Kat}][\text{M}_2]}$$
$$= \frac{1}{1 + r_{12}([\text{M}_2]/[\text{M}_1])}$$

with $P_{111} + P_{112} = 1$, $P_{222} + P_{221} = 1$, $P_{122} + P_{121} = 1$, $P_{211} + P_{212} = 1$.

The triad distribution is calculated in a manner analogous to the first-order Markov model:

$$\text{M}_1\text{M}_1\text{M}_1 = {}^1P_{11}P_{111}$$
$$\text{M}_1\text{M}_1\text{M}_2 + \text{M}_2\text{M}_1\text{M}_1 = 2\,{}^1P_{11}P_{112}$$
$$\text{M}_2\text{M}_1\text{M}_2 = {}^1P_{21}P_{212}$$
$$\text{M}_2\text{M}_2\text{M}_2 = {}^1P_{22}P_{222}$$
$$\text{M}_2\text{M}_2\text{M}_1 + \text{M}_1\text{M}_2\text{M}_2 = 2\,{}^1P_{22}P_{221}$$
$$\text{M}_1\text{M}_2\text{M}_1 = {}^1P_{12}P_{121}$$

${}^1P_{ij}$ is the frequency of the diad ij, and is calculated as follows:

$${}^1P_{11} = {}^1P_{11}P_{111} + {}^1P_{21}P_{211}$$
$${}^1P_{22} = {}^1P_{22}P_{222} + {}^1P_{12}P_{122}$$
$${}^1P_{12} = {}^1P_{11}P_{112} + {}^1P_{21}P_{212}$$
$${}^1P_{21} = {}^1P_{22}P_{221} + {}^1P_{12}P_{121}$$

It results in

$${}^1P_{21} = \frac{(1 - P_{111})(1 - P_{222})}{2(1 - P_{111})(1 - P_{222}) + P_{211}(1 - P_{222}) + P_{122}(1 - P_{111})}$$

$${}^1P_{11} = \frac{(1 - P_{222})P_{211}}{2(1 - P_{111})(1 - P_{222}) + P_{211}(1 - P_{222}) + P_{122}(1 - P_{111})}$$

$${}^1P_{22} = \frac{(1 - P_{111})P_{122}}{2(1 - P_{111})(1 - P_{222}) + P_{211}(1 - P_{222}) + P_{122}(1 - P_{111})}$$

The diad frequency ${}^1P_{ij}$ is ${}^1P_{12} = {}^1P_{21}$ and ${}^1P_{11} + 2\,{}^1P_{12} + {}^1P_{22} = 1$

C. CALCULATION OF THE COPOLYMERIZATION PARAMETERS

Once the copolymerization parameters of a catalyst system with a given ratio of monomers are known, the composition of the copolymer and all its sequence distributions result, e.g., the complete microstructure of the copolymer is revealed. These parameters characterize any catalyst system and enable different systems to be compared. The major practical problem is the choice of the adequate statistical model.

1. First-Order Markov Model

1.1. Copolymerization Parameters Deduced from the Mayo–Lewis Equation The Mayo–Lewis equation calculates the composition of the copolymer formed as a function of the ratio of the monomer concentration at a given time. At arbitrary intervals these values are generally inaccessible; thus a sufficiently small interval (a small percent of the total conversion) is taken and the relative change of the monomer concentration $d[M_2]/d[M_1]$ is assumed to be the composition of the copolymer ($[m_1], [m_2]$) itself according to

$$\lim_{dU \to 0}(d[M_2]/d[M_1]) = [m_2]/[m_1]$$

It is advisable to keep the monomer ratio $[M_2]/[M_1]$ constant during polymerization by constantly feeding both monomers, or at least the most reactive monomer. To determine the copolymerization parameters the experiments are run with varying ratios of the starting monomers, and their compositions are subsequently measured. The data obtained can be analyzed by linear or nonlinear methods.

Linear Methods: Mayo and Lewis (2), Fineman and Ross (8), Kelen and Tüdös (9)
Nonlinear Methods: Behnken (10), Tidwell and Mortimer (11), Braun et al. (12)

Independent of the analytical methods the copolymerization parameters derived from the Mayo–Lewis equation have some major drawbacks, but do enable a part of the information contained in each copolymerization experiment to be extracted, namely the integral composition of the copolymer. A series of experiments is necessary to obtain the copolymerization parameters. Furthermore, using this approach it cannot be decided whether the application of the first-order Markov model is valid or not. One may even obtain a nearly perfect Fineman–Ross plot, where other methods show that a first-order Markov model cannot be applied.

1.2. Determination of Copolymerization Parameters from the Sequence Distribution (Triad Distribution) As mentioned above, a knowledge of the copolymerization parameters enables all the sequence distributions to be calculated. Or inversely, experimentally determined sequence distributions yield the copolymerization parameters. In the simplest case, intensities of appropriate single sequences can be compared. The results are even more reliable, if the determination of the copolymerization parameters is based on the maximal accessible information on the microstructure of the copolymer. To derive the r-parameters from the overall triad distribution is the safest way (13). This may be done by calculating a triad distribution based on a first-order Markov model and optimizing by variation of the reaction probabilities P_{ij} until the best fit between calculated and experimental data

is reached. Based on the optimized reaction probabilities the copolymerization parameters r_1 and r_2 are calculated according to the following equations:

$$r_1 = ([1/P_{12}] - 1)([M_2]/[M_1])$$
$$r_2 = ([1/P_{21}] - 1)([M_1]/[M_2])$$

This, procedure for determining the copolymerization parameters is superior to the Mayo–Lewis approach. While the latter requires several experiments, using the above approach, all the information can be obtained from one experiment.

To determine the copolymerization parameters from the triad distribution, six variables are available, five of which are independent. The system is over-determined and thus allows critical evaluation.

2. Second-Order Markov Model

The second-order Markov model gives four copolymerization parameters, which are gained from the sequence distribution (full triad distribution) with a high degree of reliability. The calculated triad distribution from the second-order Markov model is optimized by varying the reaction probabilities P_{ijk} until the best fit is reached. The four copolymerization parameters are calculated from reaction probabilities P_{ijk} as follows (13–15):

$$r_{11} = ([1/P_{112}] - 1)([M_2]/[M_1])$$
$$r_{21} = ([1/P_{212}] - 1)([M_2]/[M_1])$$
$$r_{22} = ([1/P_{221}] - 1)([M_1]/[M_2])$$
$$r_{12} = ([1/P_{121}] - 1)([M_1]/[M_2])$$

The second-order Markov model results in four copolymerization parameters from six variables based on triad distribution. A higher degree of determination clearly is desirable to justify this copolymerization model. However, the complete distribution is not obtained from ^{13}C-NMR spectra of ethene/α-olefin copolymers. The full triad distribution does not exhaust the full information of the spectra, since some peaks exhibit tetrad or even pentad sensitivity. Cheng (16,17) suggested that all recorded peaks of a ^{13}C-NMR spectrum should be included to calculate the copolymerization parameters. Arbitrarily chosen reaction probabilities give rise to a polymer chain built at random, and its ^{13}C-NMR spectrum is calculated. This spectrum is superimposed on the experimental one and optimized by varying the starting values, until the minimal difference is reached. Since the ^{13}C-NMR spectra of ethene/α-olefin copolymers display many overlapping peaks, the quality of the spectra simulation very much influences the success of this method.

Randall (7) found a way to avoid this problem by creating a "collective assignment method". Here the complete triad distribution results from combining the experimental spectral information with the relation between different n-ades. In the first step the ^{13}C-NMR spectrum of an ethene/α-olefin copolymer is split into several spectral areas given by signal overlap. The ^{13}C-NMR spectra of ethene/propene copolymers, for example, are divided into eight appropriate spectral areas A to H, as shown in Fig. 1. The integrals T_x of different spectral areas are expressed by the number of contributing triads ending up in the complete triad distribution by appropriately combining several T_x-data. Randall exemplified this method in detail for ethene/propene-, ethene/1-butene-, and ethene/1-hexene-copolymerizations (7).

The resulting triad distribution allows the composition of the copolymer

$$[m_1] = M_1M_1M_1 + M_2M_1M_2 + M_2M_1M_1 + M_1M_1M_2$$
$$[m_2] = M_2M_2M_2 + M_1M_2M_1 + M_2M_2M_1 + M_1M_2M_2$$

and the average sequence length:

$$n(M_1) = [m_1]/[M_2M_1M_2 + 0.5\,(M_2M_1M_1 + M_1M_1M_2)]$$
$$n(M_2) = [m_2]/[M_1M_2M_1 + 0.5\,(M_2M_2M_2 + M_2M_2M_1)]$$

to be calculated.

3. Example

To demonstrate which model describes the experimental results best, the following table from a recent publication by Fink is reproduced (15). It is based on ethene/1-octene copolymerization experiments using a homogeneous metallocene/MAO catalyst.

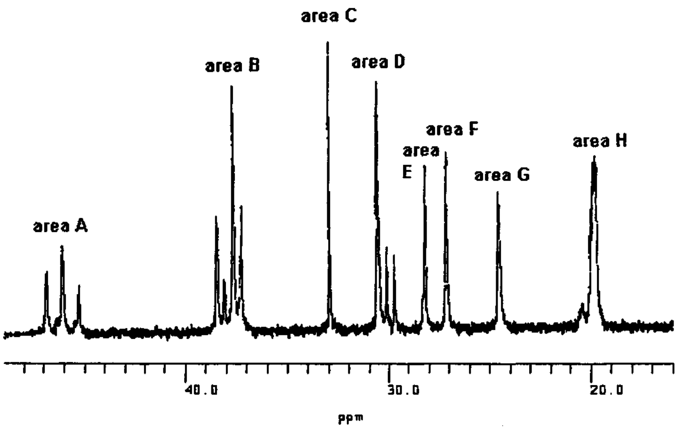

Figure 1. ^{13}C-NMR spectrum of an ethene/propene copolymer.

[a] $T_p = 60\,°C$, Kat: iPr(CpFlu)$ZrCl_2$ and MAO, [Zr] = 7.56×10^{-6} mol/l, Al/Zr = 9800.
[b] R is the sum of the least squares divided by the number of measured values.

If the experimentally determined triad distribution is compared with the calculated values based on a first-order or alternatively on a second-order Markov model (M_1 or M_2 of the table), both models give a reasonable good fit up to a monomer/comonomer ratio in solution of 1.5. Beyond a ratio of 3, however, the second-order Markov model proves to be the better approximation as indicated by the sum of the error squares divided by the number of experimental values (R of the table).

Second-order Markov statistics is only applicable when there is a sufficiently high comonomer concentration in solution, and enables the formation of α-olefin/α-olefin dual-blocks. Now the insertion of another α-olefin unit into this dual-block sequence is preferred to that into in a single-block. The complete triad distribution is gained by this procedure and it has to be performed over a wide range of the monomer/comonomer ratio in solution.

D. TABLE OF COPOLYMERIZATION PARAMETERS

A. INTRODUCTION

An attempt is made to present a systematic guide to the literature dealing with rates of polymerization, average molecular weights, and molecular weight distributions of polymers for various types of polymerization. This chapter is based on a review of molecular weight distributions (1) in which many of the equations are given in detail along with graphs showing the interrelationship among various distributions; here, we present only references to the literature. In addition, sections have been added on the effects of degradation and reactor design on the reaction rates and the molecular weight distributions. Literature references beyond (312) are those that have been added since the third edition of Polymer Handbook.

The theoretical description of the molecular weight distribution of a polymer and its rate of polymerization is dependent on the assumed mechanism of polymerization and on the mathematical simplifications used to obtain analytical expressions. As the number of distinct reactions is increased, such as the various transfer reactions, the mathematical expressions can become quite complex and unwieldy. In general, the equations for the rate of polymerization are the most difficult to describe, the distribution equations are somewhat easier, and the average molecular weights the simplest. In condensation polymerization, many of the distribution formulas are derived by considering the statistics or the probability of a given reaction instead of the kinetics of the reactions. Depending on which assumptions are made, quite different average molecular weights are derived, despite the rigor of the derivation. The emphasis in this section is, therefore, on the distribution functions and their averages; the rates of polymerization are given only if they have been explicitly derived.

This chapter is divided into several tables and sections, each treating various types of polymerization. The Stockmayer distribution function for condensation polymers is given in detail because of its general applicability and usefulness. Some general distribution functions are given in Section C. For all the other expressions, the reader must refer to the original literature. Many of the simpler functions are adequately described in textbooks of polymer chemistry. Flory (2), Bamford et al. (3), Odian (4), Billmeyer (5), and Kuechler (6) give extended descriptions of many systems. Bagdasarian (7) gives an extended discussion of methods of determining absolute values of propagation and termination constants, the influence of cage effects on the rate of initiation, and the influence

of retardation, inhibition, and diffusion-controlled termination on the rate of polymerization. A review of the various ways of deriving molecular weight distributions and the moments of a distribution is given by Chappelear and Simon (8).

Section B presents a series of tables describing the main assumption or conditions imposed on the theoretical models and references to the articles where the corresponding equations may be found. Tables 1 and 2 present rate equations and the distribution formulas for addition polymerization by a variety of mechanisms. No distinction is made among free radical, cationic, anionic, or coordination-type polymerization. While Table 1 treats those cases where termination reactions predominate and where steady-state assumptions are usually made, Table 2 treats those cases where termination reactions either do not exist, or may be considered as side reactions, having a minor to major control over the molecular weight distribution. The sequence length distributions for addition-type copolymers are omitted. However, see Kuechler (6) for an extended discussion of copolymerization distributions. Table 3 contains distribution formulas for linear condensation polymers in which the polymer is assumed to be perfectly linear and to contain no rings. Table 4 treats equilibrium polymerization. Table 5 describes nonlinear systems. Table 6 treats those cases where polymers are degraded (or altered) by the application of heat, light, or ionizing radiation. In the latter case, the polymer may undergo scission, crosslinking, or both reactions simultaneously. Several references on crosslinking are included here but not in Table 5. Finally, Table 7 is concerned with the influence of reactor design on molecular weight distribution; the kinetic equations for addition polymerization (with and without termination) and condensation polymerization are considered.

Section C lists a number of distribution functions and their properties. Among them is the generalized exponential function which is a good approximation to many real systems (Eq. C29).

Section D presents the Stockmayer distribution function for condensation polymerization wherein molecules of various types of kind A react with molecules of various types of kind B.

B. REFERENCE TABLES FOR THE CALCULATION OF RATES OF POLYMERIZATION, AVERAGE MOLECULAR WEIGHTS, AND MOLECULAR WEIGHT DISTRIBUTIONS OF POLYMERS FOR VARIOUS TYPES OF POLYMERIZATION

The following symbols are used in this chapter. R_p: rate of polymerization; R_d: rate of depolymerization; R_1^*: active, growing polymer containing one monomer unit; R_n^* and Q_n^*: active, growing polymer chains containing n monomer units; P_r: molecular weight distribution; k_i: rate constant for initiation; k_p: rate constant for propagation; I: initiator concentration; M: monomer concentration; M_n and M_w: number-average and weight-average molecular weights, respectively; 1° and 2° represent first and second order, respectively. No distinction is made among free radical, cationic, anionic, or coordination-type polymerizations.

The rate of initiation may be held constant (const) throughout the polymerization, or it may depend on some function of the catalyst and monomer concentrations, or it may be instantaneous (instant), in which case only the total number of initiating species need be known.

The rate of propagation is normally only the consumption of monomer; in some cases, the rate of propagation through terminal or pendant double bonds is also considered.

Transfer reactions may occur to initiator, momomer, solvent, or polymer.

Termination of active species may occur by a first-order deactivation, by second-order combination (comb) or disproportionation (disprop), or not at all ("living" polymers).

Confusion exists over the meaning of the transfer-to-catalyst reaction. In free radical systems, it means transfer of the active species to the initiator by a second-order mechanism. In ionic polymerization, it means the expulsion of an active fragment from a growing chain by a first-order mechanism to form dead polymer and an active initiator fragment. The first-order mechanism is called here the "catalyst expulsion reaction" (cat ex).

The nomenclature of distribution functions can be quite confusing. In this work, the Flory distribution (Eq. C41) is also known as the Schulz–Flory distribution, the "most probable" distribution, and the exponential distribution. The Schulz distribution (Eq. C36) is also known as the Schulz–Zimm distribution or the generalized Poisson distribution; at large values of k it approximates the Poisson distribution (Eq. C48). The Pearson Type III distribution is a variation of the Schulz distribution. If an addition polymer is made at constant monomer concentration, no transfer reactions occur, termination is only by second-order combination, and the distribution of the polymer is described by the Schulz distribution with $k = 2$. This distribution is sometimes called the self-convolution distribution or the convoluted exponential distribution. In a uniform distribution, all molcules have the same size – it is monodisperse. A rectangular or box distribution has no molecules below r_a, an equal number (or weight) of molecules between r_a and r_b, and no molecules whose size is above r_b.

In Table 5, systems are treated where branching reactions, ring formation, or gel formation may occur. See also Table 6 for crosslinking reactions during degradation. The symbol RA_f means a monomer containing f reactive A units. The problem of calculating the species distribution of polyfunctional condensation polymers where branched, cyclic, and crosslinked species can be formed is exceedingly complex. Most treatments apply the restriction that ring formation does not occur prior to the gel point, which obviously is incorrect. The restriction is invoked because of the transition from the pre-gel condition, where all unreacted functional groups can react without steric limitations to a condition containing rings in which some of the unreacted groups are sterically unable to react with all of the remaining unreacted groups. The problem is

further compounded because each different reacting monomer will have various degrees of steric hindrance. Therefore, a general treatment must ignore this aspect. An examination of the Stockmayer distribution function in Section D shows that in-depth calculations are required even for simple oligomer species. A number of attempts have been made to provide simpler expressions for the number or weight of individual species and the average molecular weights before and after the gel point. These include the theory of stochastic processes (271), stochastic graph theory (272), the theory of cascade processes which is based on probability generating functions (151), the use of link distribution functions (273), the recursive nature of branching processes and elementary probability laws (274), Monte Carlo methods (275), graph theory (276), and a kinetic approach (277).

2.17. POLYMER MICROSTRUCTURE							
2.17.1	Varies	Varies	None	None; concentration of head-to-head and tail-to-tail, sequence length distributions, various dyad and triad fractions	–	–	334
2.17.2	NA	NA	NA	Block copolymers	–	–	335

TABLE 3. LINEAR CONDENSATION POLYMERIZATION WITHOUT RING FORMATION

Set	Conditions	References
3.1	Condensation of bifunctional monomer AB; the Flory distribution. See Eq. (C41)	1,2,110
3.2	Bifunctional monomer AA reacting with bifunctional monomer BB; the nylon case of hexamethylene diamine and adipic acid	1,24,111
3.3	Deviations from the principle of equal reactivity; the "substitution effect"	1,112,253,254
3.4	Rate of condensation varies	
	3.4.1 Rate of condensation proportional to chain size	1,113,114,134
	3.4.2 Condensation requires rotation into colinear orientation prior to reaction	255
	3.4.3 The order of reaction varies with conversion, or a catalytic influence of unreacted A or B groups, or both effects occurring simultaneously	256
3.5	Other simple linear condensation cases	
	3.5.1 AA reacting with BC. BC is an anhydride; within a given molecule, B must react before C	1,111
	3.5.2 AA reacting with BC. BC is an unsymmetrical acid or glycol; B reacts only with A at a different rate from that of C reacting with A	1,111
	3.5.3 AB reacting with C and itself. B and C react only with A; C is a terminator or capping material	1,111
	3.5.4 AA reacting with BB and C; the nylon case again with acetic acid as terminator	1,111
	3.5.5 AA reacting with BC; A and B react with C	1,111
	3.5.6 AB reacts with CC or DD kinetics	115
	3.5.7 AA and A reacting with BB and B	336
3.6	Further polymerization of polymers with an initial geometric distribution	
	3.6.1 Further polymerization of AB when the initial distribution is geometric	1,116
	3.6.2 Further polymerization of AB when the initial distribution is a superposition of two geometric distributions	1,116
	3.6.3 Further polymerization of AA with BB when the initial distribution of both is geometric	1,116
3.7	Copolymerization of condensation polymers	
	3.7.1 AB reacting with CD; AB and CD can be hydroxy acids or similar materials	1,111
	3.7.2 AA reacting with BB and CC. A reacts with B and C only and vice versa; BB and CC can be adipic and sebacic acids	111,257
	3.7.3 AA and BB reacting with CC and DD; A and B react only with C and D and vice versa	111
	3.7.4 AA reacting with BC and DD; A reacts only with B, C, and D	111
	3.7.5 AA and DD reacting with BC; A and B react only with C and D and vice versa	111
	3.7.6 AA reacting with BC–BC, the latter can be a dianhydride; B must react before C	258,259

TABLE 3. *cont'd*

Set	Conditions	References
3.8	Coupled polymers	
	3.8.1 AB polymerized to extent of conversion α, then coupled with CC	1,117,118
	3.8.2 AB polymerized to extent of conversion α, then coupled with CD. A and B can react with C or D	1,117
	3.8.3 AA and BB polymerized to extent of conversion α, then coupled with an excess of CC. A and B to react completely on coupling	1,117
	3.8.4 Poisson-distribution polymer of AA coupled with BC	1,117
	3.8.5 Monomer AB polymerized to extent of conversion α, then coupled with excess CC to extent of conversion γ, then recoupled with excess DD	1,117
	3.8.6 Particularly narrow distributions via coupling reaction	
	I. AA and BB (great excess)→BBAABB, then remove excess BB. CC and BBAABB (great excess)→ BBAABBCCBBAABB, then remove excess BBAABB, and continue in like manner	119
	II. AA and 2BC→CBAABC then CBAABC and 2DE→EDCBAABCDE, etc	119
	III. AB and CD→ABCD then ABCD and EF→ABCDEF, etc	119
	3.8.7 Blocks of polymers of known distribution are coupled together	
	I. A series of Poisson-type-polymers coupled together	
	II. Poisson-type-polymers coupled to "most probable"-type polymers	
	III. A series of "most probable"-type polymers coupled together	120,118
3.9	AB reacts with CC or CD; rate of reaction of A dependent upon whether or not B has reacted	115
3.10	Segmented block copolymers; distribution of block sizes	260–262
3.11	Reacted sequences in homopolymers	263, 264

TABLE 4. EQUILIBRIUM POLYMERIZATION

Set	Conditions	References
4.1	The "most probable" distribution of Flory has been derived for condensation polymerization when all reactions are assumed to have the same probability, regardless of chain length, and whether or not exchange reactions occur:	Eq. C41
	$P_r + P_s = P_{r+s-i} + P_i, \quad i < r+s$	
	Here, P_i can be a byproduct such as water, or a polymer molecule whose size is smaller than $r+s$. The same distribution results when random scission occurs to infinitely long chains. See also (265) for multifunctional monomers.	2,121
4.2	The theoretical equilibrium molecular weight distribution for the system	122
	$rM = P_r$	
	depends upon the thermodynamic definition of the final product. If the change in Gibbs free energy of formation and polymerization is a linear function of molecular size *r*, then two cases can be considered:	
	4.2.1 The monomer is polymerized to a pure perfectly ordered state (solid); this gives the "most probable" distribution	Eq. C41
	4.2.2 The monomer is polymerized to a pure randomly ordered state (liquid); a completely different distribution results	123
	If the free-energy change upon disordering of the pure polymer is independent of the molecular weight distribution, a new distribution arises	124
4.3	Thermodynamics of living equilibrium polymers	125
4.4	Given an initial distribution, find the distribution as a function of time when chain ends react at random with all monomer units	126
4.5	Initiation, propagation, and termination reactions are all equilibrium reactions; an initiator is required	127
4.6	Initiation, propagation, and termination reactions are all equilibrium reactions; the system is self-initiating	127
4.7	Equilibrium initiation and equilibrium propagation with a multifunctional initiator	128,266
4.8	Equilibrium initiation and equilibrium propagation; no termination; nonequilibrium solution.	129
4.9	The catalyst can form an active species with any polymer molecule, and the total number of *moles* of the system is kept constant (constant pressure and volume if all polymer molecules are ideal gases)	130
4.10	Addition polymerization, instantaneous initiation, no transfer, no termination, monomer concentration held constant, active species in equilibrium with inactive species	77
4.11	Addition polymerization, rate of initiation equals k_iMC, no transfer, no termination, two active species in equilibrium, monomer concentration varies	78
4.12	Addition polymerization, instantaneous initiation, no transfer, no termination, active species in equilibrium with inactive species, monomer concentration varies	77
4.13	Poly(phosphate) equilibria	131
4.14	Instantaneous initiation, polymerization and depolymerization, 1° termination	132
4.15	Instantaneous initiation, polymerization and depolymerization, degradative transfer to monomer	133
4.16	Copolymerization: bimolecular addition of one monomer, equilibrium addition of other monomer	230
4.17	Copolymerization: equilibrium growth with monomer A or B adding to a chain with a terminal group of either A or B. Three cases: 2° reaction with initiator; 1° formation of active radical; 2° reaction with another monomer	267

TABLE 4. *cont'd*

Set	Conditions	References
4.18	Equilibrium copolymerization of two or more comonomers	268
4.19	Polycondensation where groups have different equilibrium constants	269,270
4.20	Equilibrium copolymerization initiated by polymer chains with active sites: average mol. wts, grafting ratio, grafting efficiency, grafting success, branching distribution, frequency of grafts	337

TABLE 5. NONLINEAR POLYMERIZATION SYSTEMS

Set	Conditions	References
5.1	Vinyl polymerization; self-grafting	
5.1.1	General case; molecular weight averages for grafted and ungrafted polymer	278
5.1.2	Constant rate of initiation, monomer concentration invariant, transfer to monomer and to polymer, termination by 2° disproportionation	1,3,18
5.1.3	Constant rate of initiation, monomer concentration varies, transfer to polymer, termination by 2° combination	135
5.1.4	Constant rate of initiation, monomer concentration can vary, transfer to monomer and to polymer, termination by 2° disproportionation and/or combination	279
5.1.5	Instantaneous initiation, monomer varies, either no transfer occurs or transfer to monomer, solvent, or polymer is allowed; termination by coupling and varies with chain length	280
5.2	Vinyl polymerization; grafting onto a performed polymer whose initial distribution is either (i) of constant length or (ii) a geometric distribution	18
5.3	Vinyl polymerization; all segments of the backbone chains have equal probability to be grafted	136
5.4	Vinyl polymerization; terminal double-bond polymerization, monomer concentration varies, transfer to monomer and to polymer, terminal double bond polymerization	
5.4.1	Termination predominantly by transfer, constant rate of initiation; batch or continuous polymerization	1,137–139
5.4.2	Termination by disproportionation, constant rate of initiation, includes transfer to solvent	338
5.4.3	Termination by combination, constant rate of initiation, amount of short and long chain branching, transfer to a tertiary site	338,339
5.4.4	Termination by combination, initiator and monomer concentration vary, transfer to monomer and to polymer	340
5.4.5	Termination by combination, initiator and monomer concentration vary, transfer to monomer and to polymer, characterization following saponification and reacetylation	341
5.5	Vinyl polymerization; long-chain branching.	
5.5.1	constant rate of initiation, monomer concentration invariant, transfer to monomer and to polymer, termination by 2° disproportionation	1,140
5.5.2	"Living polymer". Instantaneous initiation, β-hydride or β-methyl elimination to form a terminal double bond, transfer with agent to form a saturated end	355
5.6	Vinyl polymerizaton; "living" branched polymer; polyfunctional initiator RA_f; rate of initiation equals rate of propagation, no transfer, no termination	141
5.7	Vinyl polymerization; R_p, in a diffusion controlled gelling system; termination by disproportionation or combination, no transfer	142
5.8	Vinyl polymerization; branching density as a function of conversion; branches formed by polymerization through a vinyl group (diene polymers) or by transfer-to-polymer reaction	
5.8.1	Batch polymerization	1,2
5.8.2	Continuous polymerization	1,138
5.9	Vinyl polymerization	
5.9.1	Branching density as a function of conversion of (1) long-chain branching, (2) short-chain branching (backbiting), (3) very short chain branching (radical migration)	143
5.9.2	Copolymerization with divinyl, no ring formation prior to gelation	274,281
5.9.3	Copolymerization with divinyl; ring formation permitted; Monte Carlo calculations for crosslinking density, weight fraction of gel; chain-length distribution between crosslinks	342,343
5.9.4	Circuits in a network, elastically active chains	282,283
5.10a	Emulsion polymerization; branch density	144,344
5.10b	Emulsion polymerization; Monte Carlo calculations; can account for desorption of oligomers, chain-length dependence of kinetic parameters, chain transfer to monomer and solvent, polymerization through terminal double bonds and long-chain branching	345
5.11	Cyclopolymerization: the concentration of pendent double bonds per molecule	145–149
5.12	Gelation condition in a system when cyclopolymerization also occurs; transfer to monomer reaction occurs. Molecular weight given	150
5.13	General theory of gelation for polyaddition- and polycondensation-type polymers	151
5.14	The general distribution function for various molecules of type A reacting with various molecules of type B; A can only react with B	
5.14.1	All functional groups have equal reactivity, independent of position within the molecule or the size of the molecule. Ring formation excluded	Section D 276

TABLE 5. *cont'd*

Set	Conditions	References
	5.14.2 Monomers of type RA_f (f can vary) can only react with monomers of type RB_g (g can vary) where the various B's can have different reactivities. No ring formation	284
	5.14.3 Monomers of type RA_f and RB_g where f and g can vary, the reactivity of a given B can depend on whether or not an adjacent B on the same molecule has reacted. No ring formation	285
	5.14.4 Monomers of type RA_f and RB_g where f and g can vary; no ring formation; calculation of higher distribution moments	346
5.15	Crosslinking or coupling of a polymer with a known primary distribution (see also Table 6)	
	5.15.1 General case. No ring formation prior to gelation	1,152–155, 286
	5.15.2 All primary chains have the same size; no ring formation prior to gelation	1,2,152, 155–157
	5.15.3 Primary chains of the Poisson type, (Eq. C48); no ring formation prior to gelation	155,157
	5.15.4 Primary chains of the Schulz type, (Eq. C36); no ring formation prior to gelation	286
	5.15.5 Primary chains of the "most probable" type; ring formation allowed prior to gelation	287
	5.15.6 Formation of star-type polymers	288
5.16	Homopolymer of ARB_{r-1}. A can react only with B; the B's may have different reactivities. Formation of rings excluded prior to gelation	
	5.16.1 All B groups have the same reactivity	1,2,158,265, 289
	5.16.2 Let B groups have different reactivities	1,159,160
	5.16.3 A controversy over the statistical approach	161,162,163, 164
5.17	Copolymer of ARB_{f-1} and AB; A can react only with B; formation of rings excluded prior to gelation	1,2,158
5.18	Homopolymer of RA_f; formation of rings excluded prior to gelation	
	5.18.1 All A's equally reactive	1,2,121,158, 165,166, 265,274, 277,281, 290–292
	5.18.2 Reactivity of A depends on number of A's previously reacted	167,273,293
5.19	Various copolymers	
	5.19.1 Copolymer of RA_f and AA; formation of rings excluded prior to gelation	1,2,165
	5.19.2 Copolymer of RA_f, AA, and BB; A can react only with B; formation of rings excluded prior to gelation; all branch points completely reacted. See set 5.16.3 for a controversy	1,168,169
	5.19.3 A mixture of self-condensing monomers R_1A_g, R_2A_h, etc., no ring formation	277,294,295
	5.19.4 A stoichiometric mixture of RA_f and RB_f of the same functionality f, indistinguishable reactivity, no ring formation. Note that different authors get different equations for M_n and M_w	277
	5.19.5 A stoichiometric mixture of RA_f, RA_g, ... and RB_h, RB_i ..., f, g, h, i being different functionalities, indistinguishable reactivities, no ring formation	277,294
	5.19.6 A copolymer of RA_f and BB; no ring formation prior to gelation	274,281,290
	5.19.7 A copolymer of RA_f, AA, and $B'B''$ where B' has a different reaction rate from B''; no rings prior to gelation	293
	5.19.8 Copolymer of RA_f, AA, and BB where the A's in RA_f can have different rates of reaction	293
5.20	Polymers of RA_fB_g	
	5.20.1 Homopolymer of RA_fB_g; A can only react with B; formation of rings excluded prior to gelation	170,265
	5.20.2 A mixture of monomers RA_fB_g, where $f, g = 0, 1, 2, \ldots$, stoichiometry not required	295
5.21	Branching without gelation; copolymer of RA_f and AB. A can react only with B	1,171
5.22	Gelation conditions; formation of rings excluded prior to gelation	
	5.22.1 AA reacting with B_fC_g. A can react with B and C, but with different velocities. B cannot react with C	1,172
	5.22.2 AA, BB, and C reacting with DDE and FF; A, B, and C individually can react with D, E, and F, but with different velocities	1,172
	5.22.3 AAB, RC_4, and GC reacting with DE and F. DE is an anhydride or similar material. D must react first and may have a different velocity from E. A, B, C. and G may react with different velocities	1,172
	5.22.4 AB and CD reacting with EEF and GG. AB and CD are anhydrides or similar materials, where A must react before B and C must react before D. A, B, C, and D may react with different velocities	1,172
	5.22.5 AA and BC reacting with DDE and FG. BC is an anhydride, B reacting first, and FG is like an unsymmetrical glycol	1,172
5.23	Ring formation in linear polymers	
	5.23.1 Homopolymer of type AA	1,173,174
	5.23.2 Homopolymer of type AA. Formation of catenanes	296
	5.23.3 Homopolymer of type AB	1,173,175
	5.23.4 Copolymer of type AABB	1,173,176
	5.23.5 Distribution for chain fraction	1,2
	5.23.6 Copolymer of AA with BC. BC can be an anhydride; within a given molecule, B must react before C; A single cyclic oligomer is permitted to form	297
	5.23.7 Ring-chain equilibrium constant, R_p of rings, cut-off point of monomer conc below which only cyclics formed	347
5.24	Crosslinking of a polymer with a known distribution; rings are permitted prior to gelation	153

TABLE 5. *cont'd*

Set	Conditions	References
5.25	Gelation conditions for RA_f when rings are permitted prior to gelation	1,177
5.26	Homopolymer of RA_f. Ring formation permitted prior to gelation	1,178,179, 298
5.27	Copolymer of RA_f and BB when rings are permitted prior to gelation	180
5.28	Gelation condition for RA_f, AA, and BB when rings are permitted prior to gelation	1,181
5.29	Monte Carlo calculations on small amounts of crosslinking	299
5.30	Monte Carlo calculations for RA_3, the reactivity of an A group depends on the number of previously reacted groups on that monomer, no ring formation prior to gelation	275
5.31	Monte Carlo calculations for vinyl and divinyl copolymerization	300
5.32	Grafting of reactive polymers of the type AA, AAB, BB, and BBA where rings can form prior to gelation; M_w and the gel point	348
5.33	Star type molecules prepared by anionic polymerization and different precursors (see also 5.19.1, 5.21 and 5.27)	349

TABLE 7. INFLUENCE OF REACTOR CONDITIONS AND DESIGN ON THE MOLECULAR WEIGHT DISTRIBUTION

Set	Conditions	References
7.1	Comparison of 1° term, 2° term with monomer, 2° disprop, 2° comb, and no term for 1° and 2° self-initiation and initiation by light in a CFSTR[a]: R_p, P_r and M_n are given	214
7.2	Emulsion polymerization	
	7.2.1 Emulsion polymerization in a CFSTR. Instantaneous 2° termination	215
	7.2.2 Emulsion polymerization in isothermal BR[a]; 1° init, termination with initiator, four stages of polymerization	304
7.3	Effect of inadequate stirring in a CFSTR; comparison with BR and normal CFSTR. Term. by 2° or no term. R_p, $P_r M_n$'s	216
7.4	Control of MWD[a] by use of temperature variation; term by 2° disprop or 2° comb. M_n's	217
7.5	Effect of expanding drop of monomer in a catalyst solution on MWD of "living" polymers	218
7.6a	Effect of inadequate mixing by a laminar shear model on MWD of "living" polymers	219
7.6b	Effect of different flow lines spending different times in the reactor on the MWD of "living" polymers; the bimodal MWD changes with reactor length	353
7.7	Effect of varying rate of addition of initiator and/or monomer, transfer agent, or terminator, in a BR, neglecting change in volume	220
7.8	Effect of varying the rate of addition of an instantaneous initiator on MWD of "living" polymers	103,221
7.9	Effect of back mixing on MWD of "living" polymers prepared in BR, semi-BR, and CFSTR	222
7.10	See also Table 3, set 3.6: Further polymerization of polymers with an initial geometric distribution	
7.11	Linear condensation of a multifunctional monomer in a BR	305
7.12	"Living" polymer, inst. initiation, no transfer, no termination in a TR[a], monomer varies	306,307
7.13	Effect of mixing in a BR	308
7.14	Condensation polymerization when monomer is R times more reactive with monomer or with polymer molecules, CFSTR, and references to BRs	309,310
7.15	Effect of recycling a portion of a TR; chain-stopper control	311
7.16	Production of monodisperse particles	312
7.17	Reversible polymerization with multifunctional monomers. Comparison of MWD from CFSTR with BR	354

[a]CFSTR: Continuous-flow, stirred tank reactor; BR: batch reactor; TR: tube reactor; MWD: molecular weight distribution.

C. SOME DISTRIBUTION FUNCTIONS AND THEIR PROPERTIES

The frequency function, $F(r)$, is the fraction of molecules of size r. Furthermore, $F(r)$ is normalized

$$\sum_1^\infty F(r) = \int_0^\infty F(r)\,dr = 1 \qquad \text{(C1)}$$

The weight fraction of molecules of size r is

$$W(r) = rF(r)\Big/\sum_1^\infty rF(r) = rF(r)\Big/\int_0^\infty rF(r)\,dr \qquad \text{(C2)}$$

Averages of any distribution are defined by

$$\sum_1^\infty r^iF(r)\Big/\sum_1^\infty r^{i-1}F(r) = \int_0^\infty r^iF(r)\,dr\Big/\int_0^\infty r^{i-1}F(r)\,dr \qquad \text{(C3)}$$

The number-average degree of polymerization is defined by

$$\bar{r}_n = \sum_1^\infty rF(r)\Big/\sum_1^\infty F(r) = \sum_1^\infty W(r)\Big/\sum_1^\infty [W(r)/r] \qquad \text{(C4)}$$

Thus, by the definitions of $F(r)$ and $W(r)$

$$W(r) = rF(r)/\bar{r}_n \qquad \text{(C5)}$$

The weight-average degree of polymerization is

$$\bar{r}_w = \sum_1^\infty r^2F(r)\Big/\sum_1^\infty rF(r) = \sum_1^\infty rW(r)\Big/\sum_1^\infty W(r) \qquad \text{(C6)}$$

The z and $z + 1$ averages are defined by Eq. (C3) with i set equal to 3 and 4. There is no need to restrict averages of a distribution to positive integers – any useful average can be defined; such as the $(-5/2)$ average. If the intrinsic viscosity of a polymer is related to the degree of polymerization through the equation

$$[\eta] = k\bar{r}_v^a, \qquad \text{(C7)}$$

where $\bar{r}_v$ is the viscosity-average degree of polymerization, it is related to the frequency function by

$$\bar{r}_v = \left[\sum_1^\infty r^{1+a}F(r)\Big/\sum_1^\infty rF(r)\right]^{1/a} \qquad \text{(C8)}$$

As a approaches unity, $\bar{r}_v$ approaches $\bar{r}_w$. In principle, a distribution function can be determined if sufficient averages of the distribution can be determined. In practice, only the number, weight, and perhaps z averages can be found, which are insufficient to define any distribution without making further assumptions.

The degree of polymerization is a useful concept as long as one is describing polymers made with a single monomer or with monomers of equal molecular weight. When considering copolymers, one must work with the actual molecular weight of the reacted unit. This is done in condensation polymerization. The molecular weight distribution of addition copolymers is not included here because of the extreme complexity of these systems.

When performing the summation of a distribution equation to find an average of the distribution, use is frequently made of the following sums:

$$\sum_{x=1}^{\infty} p^{x-1} = 1/(1-p) \quad p<1 \tag{C9}$$

$$\sum_{x=1}^{\infty} xp^{x-1} = 1/(1-p)^2 \quad p<1$$

$$\sum_{x=1}^{\infty} x^2p^{x-1} = (1+p)/(1-p)^3 \quad p<1$$

$$\sum_{x=1}^{\infty} x^np^{x-1} = \frac{\mathrm{d}}{\mathrm{d}p}\left[p\sum_{x=1}^{\infty} x^{n-1}p^{x-1}\right] \quad p<1$$

$$\sum_{i=0}^{\infty} a^{n-i}b^i n!/(n-i)!\,i! = (a+b)^n \quad n \text{ is an integer}$$

$$\sum_{i=0}^{\infty} a^i in!/(n-i)!\,i! = na(1+a)^{n-1}$$

$$\sum_{i=0}^{\infty} a^i i^2 n!/(n-i)!\,i! = na(1+na)(1+a)^{n-2}$$

$$\sum_{n=1}^{\infty} A^{n-1}/(n-1)! = \exp A$$

$$\sum_{n=1}^{\infty} nA^{n-1}/(n-1)! = (1+A)\exp A$$

$$\sum_{n=1}^{\infty} n^2A^{n-1}/(n-1)! = (1+3A+A^2)\exp A$$

$$\sum_{n=1}^{\infty} n^pA^{n-1}/(n-1)! = \frac{\mathrm{d}}{\mathrm{d}A}\left[A\sum_{n=1}^{\infty} n^{p-1}A^{n-1}/(n-1)!\right]$$

1. Normal Distribution Function (Gaussian Distribution)

$$F(r) = \frac{\exp\{-(r-\bar{r})^2/2\sigma^2\}}{(2\pi)^{1/2}\sigma} \tag{C10}$$

$$W(r) = (r/\bar{r})F(r) \tag{C11}$$

$$\bar{r} = \int_{-\infty}^{+\infty} \frac{r\exp\{-(r-\bar{r})^2/2\sigma^2\}}{(2\pi)^{1/2}\sigma} = \bar{r}_n \tag{C12}$$

$$\sigma^2 = \int_{-\infty}^{+\infty} \frac{(r-\bar{r})^2\exp\{-(r-\bar{r})^2/2\sigma^2\}}{(2\pi)^{1/2}\sigma} \tag{C13}$$

$$\bar{r}_w = \frac{\sigma^2}{\bar{r}} + \bar{r} \tag{C14}$$

Values of $F(r)$ and $\int_0^t F(r)\,\mathrm{d}r$ are found in many statistical tables (223).

2. Logarithmic Normal Distribution Function

Under the assumption that the weight distribution of the logarithm of molecular size is normally distributed, we can replace r in the normal distribution function by $\ln r$ and $\bar{r}$ by $\ln \bar{r}_m$

$$W(\ln r) = \frac{\exp\{-(\ln r - \ln \bar{r}_m)^2/2\sigma^2\}}{(2\pi)^{1/2}\sigma} \tag{C15}$$

where

$$\int_1^{\infty} W(\ln r)\,\mathrm{d}(\ln r) = 1 \tag{C16}$$

or in the alternate form

$$W(r) = \frac{\exp\{-(\ln r - \ln \bar{r}_m)^2/2\sigma^2\}}{r(2\pi)^{1/2}\sigma} \tag{C17}$$

where

$$\int_0^{\infty} W(r)\,\mathrm{d}r = 1 \tag{C18}$$

and

$$\ln \bar{r}_m = \int_0^{\infty} (\ln r)W(r)\,\mathrm{d}r \tag{C19}$$

Here $\bar{r}_m$ is the median value of the distribution, that is, one-half of the values of r are less than $\bar{r}_m$.

$$\sigma^2 = \int_0^{\infty} (\ln r - \ln \bar{r}_m)^2 W(r)\,\mathrm{d}r \tag{C20}$$

$$\bar{r}_n = \bar{r}_m \exp(-\sigma^2/2) \tag{C21}$$

$$\bar{r}_w = \bar{r}_m \exp(+\sigma^2/2) \tag{C22}$$

$$\bar{r}_z = \bar{r}_m \exp(+3\sigma^2/2) \tag{C23}$$

$$\bar{r}_i = \bar{r}_m \exp\{(2i-3)\sigma^2/2\} \tag{C24}$$

Note that

$$\bar{r}_m = (\bar{r}_n\bar{r}_w)^{1/2} \tag{C25}$$

$$\bar{r}_w/\bar{r}_n = \bar{r}_z/\bar{r}_w = \bar{r}_{z+1}/\bar{r}_z = \exp\sigma^2 \tag{C26}$$

The logarithmic normal distribution sometimes is given in a "generalized" form (224)

$$W_s(r) = \frac{r^s\exp[-(\ln r/\bar{r}_s)^2/2\sigma^2]}{(2\pi)^{1/2}\sigma\bar{r}_s^{s+1}\exp\{(s+1)^2\sigma^2/2\}} \tag{C27}$$

but Honig (225) has shown that

$$\ln \bar{r}_{\mathrm{m}} = \ln \bar{r}_{\mathrm{s}} + (s+1)\sigma^2 \qquad \text{(C28)}$$

Thus, the normalized Lansing–Kramer function ($s = 0$) (226) is identical to the normalized Wesslau function ($s = -1$) (227).

The generalized logarithmic normal distribution is skewed to large values of r, but Kotliar (237, 238) shows that this distribution is not a good representation of a polymer after either low- or high-molecular weight material is removed or degradation has occurred.

3. Generalized Exponential Distribution (1,228)

$$F_{m,k,y}(r) = my^{k/m} r^{k-1}[\exp(-yr^m)]/\Gamma(k/m) \qquad \text{(C29)}$$

$$W_{m,k,y}(r) = my^{(k+1)/m} r^{k}[\exp(-yr^m)]/\Gamma[(k+1)/m] \qquad \text{(C30)}$$

$$\bar{r}_n = \Gamma[(k+1)/m]/y^{1/m}\Gamma(k/m) \qquad \text{(C31)}$$

$$\bar{r}_w = \Gamma[(k+2)/m]/y^{1/m}\Gamma[(k+1)/m] \qquad \text{(C32)}$$

$$\bar{r}_z = \Gamma[(k+3)/m]/y^{1/m}\Gamma[(k+2)/m] \qquad \text{(C33)}$$

$$\bar{r}_i = \Gamma[(k+i)/m]/y^{1/m}\Gamma[(k+i-1)/m] \qquad \text{(C34)}$$

and

$$r_{\mathrm{v}} = \{\Gamma[(k+a+1)/m]/y^{a/m}\Gamma[(k+1)/m]\}^{1/a} \qquad \text{(C35)}$$

where a is defined by equation (C7).

The variance of a distribution σ^2, the usual measure of distribution breadth for small populations, depends strongly on the average molecular weight of the distribution:

$$\sigma^2 = \bar{r}_{\mathrm{n}}(\bar{r}_{\mathrm{w}} - \bar{r}_{\mathrm{n}})$$

Hence, the preferred measure of the molecular weight distribution breadth is $\bar{r}_{\mathrm{w}}/\bar{r}_{\mathrm{n}}$.

(a) The distribution function of Schulz (9) and Zimm (229) is obtained by setting $m = 1$ and requiring that $k > 0$. This distribution is equivalent to the Pearson Type III distribution

$$F(r) = y^k r^{k-1}[\exp(-yr)]/\Gamma(k) \qquad \text{(C36)}$$

$$W(r) = y^{(k+1)} r^{k}[\exp(-yr)]/\Gamma(k+1) \qquad \text{(C37)}$$

The distribution reduces to the "most probable" distribution where $k = 1$.

The cumulative number or weight fraction of the Schulz distribution may be computed from

$$\int_0^r F_{1,k,y}(r) = \frac{ky^k}{\Gamma(1+k)} \sum_{i=0}^{\infty} \frac{(-1)^i y^i r^{k+i}}{i!\,(k+i)} \qquad \text{(C38)}$$

$$\int_0^r W_{1,k,y}(r) = \frac{y^{k+1}}{\Gamma(1+k)} \sum_{i=0}^{\infty} \frac{(-1)^i y^i r^{k+i+1}}{i!\,(a+i+1)}. \qquad \text{(C39)}$$

(b) The Weibull (231) or Tung (232) distribution is obtained by setting $m = 1 + k$ and $k > 0$. This distribution is usually seen in the form

$$\int_0^r W(r)\,\mathrm{d}r = 1 - \exp[-yr^{(1+k)}] \qquad \text{(C40)}$$

Kotliar (233) shows that evaluation of y and k by the Tung method can lead to erroneous values of $\bar{r}_{\mathrm{w}}/\bar{r}_{\mathrm{n}}$.

(c) The Flory distribution, as noted above, occurs when $k = m = 1$, provided that $\ln p$ can be replaced by $-(1-p)$, i.e. $p \approx 1$. The Flory distribution is also written as:

$$F(r) = p^{r-1}(1-p) \qquad \text{(C41)}$$

$$W(r) = rp^{r-1}(1-p)^2 \qquad \text{(C42)}$$

$$\bar{r}_{\mathrm{n}} = 1/(1-p) \qquad \text{(C43)}$$

$$\bar{r}_{\mathrm{w}} = (1+p)/(1-p) \qquad \text{(C44)}$$

$$\bar{r}_{\mathrm{v}} = \bar{r}_{\mathrm{n}}([\Gamma(2+a)]^{1/a} \qquad \text{(C45)}$$

and with the approximation $\ln p = p - 1$

$$\int_0^r W(r)\,\mathrm{d}r \cong (1/p) - [1 + (1-p)r]p^{r-1} \qquad \text{(C46)}$$

For high molecular weights $p \approx 1$, hence

$$r_{\mathrm{n}} : r_{\mathrm{w}} : r_{\mathrm{z}} = 1:2:3. \qquad \text{(C47)}$$

4. Poisson Distribution

$$F(r) = \exp(-\nu)\,\nu^{r-1}/(r-1)! \qquad \text{(C48)}$$

$$W(r) = [\nu/(\nu+1)]r\exp(-\nu)\,\nu^{r-2}/(r-1)! \qquad \text{(C49)}$$

$$\bar{r}_{\mathrm{n}} = 1 + \nu \qquad \text{(C50)}$$

$$\bar{r}_{\mathrm{w}} = 1 + \nu + \nu/(1+\nu) \qquad \text{(C51)}$$

D. MOLECULAR WEIGHT DISTRIBUTION IN CONDENSATION POLYMERS: THE STOCKMAYER DISTRIBUTION FUNCTION

Stockmayer (234) has presented a generalized distribution formula for a variety of monomers containing end groups of type A which can only react with a variety of monomers containing end groups of type B. In the original mixture there are $A_1, A_2, A_3, \ldots, A_i, \ldots$ moles of reactants bearing respectively, $f_1, f_2, f_3, \ldots, f_i, \ldots$ functional groups of type A each, together with $B_1, B_2, \ldots, B_j, \ldots$ moles of reactants of functionalities $g_1, g_2, \ldots g_j, \ldots$ in groups of type B. all functional groups of a given type are equally reactive and ring formation does not occur appreciably; which obviously is not true near the gel point. The system reacts until a fraction α of the A groups and a fraction β of the B groups

have reacted. Further

$$\alpha \sum_i f_i A_i = \beta \sum_j g_j B_j$$

Now $N\{m_n, n_j\}$ represents the number of moles of that species which consists of $m_1, m_2, \ldots, m_i, \ldots$ monomer units of the A type combined with $n_1, n_2, \ldots, n_j$ units of the B type.

$$N\{m_i, n_j\} = \frac{K(\sum_i f_i m_i - \sum_i m_i)!\,(\sum_j g_j n_j - \sum_j n_j)!\,\Pi_i(x_i^{m_i}/m_i!)\Pi_j(y_j^{n_j}/n_j!)}{(\sum_i f_i m_i - \sum_i m_i - \sum_j n_j + 1)!\,(\sum_j g_j n_j - \sum_j n_j - \sum_i m_i + 1)!} \tag{D1}$$

where

$$\begin{aligned} x_i &= \left[\frac{f_i A_i}{(\sum_i f_i A_i)}\right]\left[\frac{\beta(1-\alpha)^{f_i-1}}{(1-\beta)}\right] \\ y_j &= \left[\frac{g_j B_j}{(\sum_j g_j B_j)}\right]\left[\frac{\alpha(1-\beta)^{g_j-1}}{(1-\alpha)}\right] \\ K &= \left(\sum_i f_i A_i\right)(1-\alpha)(1-\beta)/\beta \\ &= \left(\sum_j g_j B_j\right)(1-\alpha)(1-\beta)/\alpha \end{aligned} \tag{D2}$$

An example will illustrate the use of Eq. (D1).

Suppose we have the monomers acetic acid (CH_3COOH, $A_1, f_1 = 1$) and adipic acid ($HOOC(CH_2)_4COOH$, $A_2, f_2 = 2$) reacting with ethylene glycol ($HOCH_2CH_2OH$, $B_1, g_1 = 2$) and glycerol ($HOCH_2CHOHCH_2OH$, $B_2, g_2 = 3$) (all hydroxyl groups of the glycerol are considered equally reactive). What is the number of molecules which contain exactly 1 acetic acid unit, 4 adipic acid units, 3 glycol units, and 2 glycerol units? It is $N\{1,4,3,2\}$ and

$$\begin{aligned} N\{1,4,3,2\} &= K(1+8-1-4)!\,(6+6-3-2)! \\ &\div (1+8-1-4-3-2+1)! \\ &\div (6+6-3-2-1-4+1)! \\ &\times \left(\frac{x_1^1}{1!}\right)\left(\frac{x_2^4}{4!}\right)\left(\frac{y_1^3}{3!}\right)\left(\frac{y_2^2}{2!}\right) \end{aligned} \tag{D3}$$

where

$$\begin{aligned} x_1 &= \left[\frac{A_1}{A_1+2A_2}\right]\left[\frac{\beta}{1-\beta}\right], \\ x_2 &= \left[\frac{2A_2}{A_1+2A_2}\right]\left[\frac{\beta(1-\alpha)}{(1-\beta)}\right] \\ y_1 &= \left[\frac{2B_1}{2B_1+3B_2}\right]\left[\frac{\alpha(1-\beta)}{(1-\alpha)}\right], \\ y_2 &= \left[\frac{3B_2}{2B_1+3B_2}\right]\left[\frac{\alpha(1-\beta)^2}{(1-\alpha)}\right] \\ K &= (A_1+2A_2)(1-\alpha)(1-\beta)/\beta \end{aligned} \tag{D4}$$

If each species i has an effective molecular weight M_i, which is lower than the original molecular weight by the term $W_0 f_i/2$, where W_0 is the molecular weight of the by-product, then

$$W = \sum_i M_i A_i + \sum_j B_j M_j \tag{D5}$$

The number of molecules of the end of the reaction is, neglecting byproduct,

$$N = \sum_i A_i + \sum_j B_j - \alpha \sum_i f_i A_i \tag{D6}$$

The number-average molecular weight is

$$\bar{M}_n = W/N \tag{D7}$$

The weight-average molecular weight is

$$\begin{aligned} \bar{M}_w = &\left[\beta\frac{\sum_i M_i^2 A_i}{\sum_i f_i A_i} + \alpha\frac{\sum_j M_j^2 B_j}{\sum_j g_j B_j}\right. \\ &\left. + \frac{\alpha\beta\left[\alpha(f_c-1)M_b^2 + \beta(g_c-1)M_a^2 + 2M_a M_b\right]}{1-\alpha\beta(f_c-1)(g_c-1)}\right] \\ &\times \left[\beta\frac{\sum_i M_i A_i}{\sum_i f_i A_i} + \alpha\frac{\sum_j M_j B_j}{\sum_j g_j B_j}\right]^{-1} \end{aligned} \tag{D8}$$

where

$$\begin{aligned} f_c &= \left(\sum_i f_i^2 A_i\right) \Big/ \left(\sum_i f_i A_i\right) \\ g_c &= \left(\sum_j g_j^2 B_j\right) \Big/ \left(\sum_j g_j B_j\right) \\ M_a &= \left(\sum_i M_i f_i A_i\right) \Big/ \left(\sum_i f_i A_i\right) \\ M_b &= \left(\sum_j M_j g_j B_j\right) \Big/ \left(\sum_j g_j B_j\right) \end{aligned} \tag{D9}$$

Simpler expressions for M_n and M_w are given by Ziegel et al. (235) for the case when only bifunctional B monomers are present.

The gel point is

$$(\alpha\beta)_c = 1/(f_c-1)(g_c-1) \tag{D10}$$

Extensive computations of $N\{m_i, n_j\}$ for the case $f_1 = 1, f_2 = 2, f_4$, and $g_2 = 2$ have appeared (236).

A. HEATS OF POLYMERIZATION

Symbols: The subscripts xx to ΔH denote the state of the monomer (first letter) and the state of the polymer (second letter), as follows:

- g Gaseous state (hypothetical in case of polymer)
- c Condensed amorphous state
- c′ Crystalline or partially crystalline state
- l Liquid state
- s In solution; solvent specified in the sixth column (ls denotes polymer dissolved in monomer).

For emulsion polymerization the subscript lc is used and a note added in the sixth column. In all cases where monomer or polymer is present in solution etc., the value of ΔH will depend on the composition to some extent. Where the polymer is crystalline, ΔH will depend on the degree of crystallinity. ΔH values are in kJ per mol of monomer and are generally the limiting values for high degree of polymerization n [1 kcal = 4.187 kJ]. Where more than one value is available in the literature for given states of monomer and polymer and a given method, only one value is shown in the tables. This corresponds to one of the references indicated N_i refers to the ith note given at the end of the table.

Example: $C_2H_4(g) \rightarrow (1/n)(C_2H_4)_n(g), \quad \Delta H_{gg} = -93.5\,kJ$

Precision: generally 0.5–4.0 kJ/mol (for details see Ref. 1).

Methods of determination: These are summarized below, using the numbering system in Ref. 1.

- 2 Combustion of monomer or polymer or both.
- 3 Reaction calorimetry.
- 4a Thermodynamic (van't Hoff Equation).
- 4b Semiempirical rules applied to evaluate heat of formation of polymer or monomer or both. Such rules may be found in Refs. 25,143,223,224,335.
- 5 Heat capacity and heat of transition (Kirchhoff's equation).

TABLE 1. MONOMERS GIVING POLYMERS CONTAINING CARBON ATOMS ONLY IN THE MAIN CHAIN

Monomer	State of monomer and polymer (xx)	$-\Delta H_{xx}$ (kJ/mol)	Temp. (°C)	Method	Solvent/Notes	Refs.

B. ENTROPIES OF POLYMERIZATION

Symbols: The subscripts to $\Delta S°$ denote the state of the monomer (first letter) and the state of the polymer (second letter) as in Section A. The standard state of the monomer is 1 atm for the gaseous state and 1*M* in solution, unless otherwise stated. In all cases where monomer or polymer is present in solution, the value of $\Delta S°$ will depend to some extent on the composition. Where the polymer is crystalline, $\Delta S°$ will depend on the degree of crystallinity. ΔS values are in (J/K) per mol of monomer and are generally the limiting values for high degree of polymerization (1 kcal = 4.187 kJ).

Notes page II-406; References page II - 407

Precision: generally 0.5–8.0 (J/K/mol)

Methods of determination: (numbering conforms with that in Section A)
1 Third law or statistical.
4a Thermodynamic (van't Hoff Equation).
4b Semiempirical rules applied to evaluate entropy of monomer or polymer or both.

TABLE 4. MONOMERS GIVING POLYMERS CONTAINING MAIN CHAIN CARBON ONLY

C. CEILING TEMPERATURES AND EQUILIBRIUM MONOMER CONCENTRATIONS

Most addition polymerization reactions are exothermic and exentropic. The free energy of polymerization per monomer unit therefore becomes less negative as the temperature is raised. At the *ceiling temperature* T_c, the free energy of polymerization under the prevailing conditions is zero, and above this temperature, polymerization to long-chain polymer is impossible (just as in physical aggregation a liquid cannot form a solid when the temperature is above the melting point). The reverse phenomenon of a *floor* temperature is also known, e.g., for sulfur.

In general a pure liquid monomer which gives an *insoluble polymer* will have a single well-defined ceiling temperature, given by $T_c = \Delta H_{lc}/\Delta S_{lc}$. A pure liquid monomer which gives a *soluble* polymer will have a series of ceiling temperatures corresponding to different percentage conversions of monomer to polymer. The condition for equilibrium is then

$$-\Delta\bar{G}_1 + \Delta G_{lc} + \Delta\bar{G}_2 = 0$$

The partial molar free energy per mol of monomer, $\Delta\bar{G}_1$ and per base mol of polymer, $\Delta\bar{G}_2$ are then functions of composition and may be evaluated from an appropriate equation for mixing of monomer and polymer, e.g., the Flory–Huggins equation. For a monomer dissolved in a solvent the situation is more complex and the ceiling temperature at a given monomer concentration (or the equilibrium concentration of monomer at a given temperature) is dependent on the nature of the solvent and the composition of the medium (Refs. 28,29,112,113,114,160). For the case where both monomer and polymer are in solution the variation of T_c with concentration is given to a first approximation by

$$T_c = \Delta H^\circ_{ss}/(\Delta S_{ss} + R\ln[M])$$

where $[M]$ is the concentration of monomer and ΔH°_{ss} and ΔS°_{ss} refer to the heat and entropy changes in an appropriate standard state. A more general expression may be derived from the free energy condition by insertion of suitable expressions for $\Delta\bar{G}_1$ and $\Delta\bar{G}_2$. These will contain the various interaction parameters appropriate to the polymer–monomer–solvent system.

The values of T_c quoted in the table are mostly obtained from experimental values by interpolation or short extrapolation. Some unpolymerizable monomers are included where these are structurally closely related to monomers which do polymerize and where the cause of nonpolymerization appears to be thermodynamic. This is amplified for cyclic monomers in Section D.

Section C is divided into three sections

1 Equilibria involving pure liquid monomers (lc, lc′, ls)
2 Equilibria involving gaseous monomers (gc, gc′)
3 Equilibria involving monomers in solution (sc, sc′, ss) and copolymerizations

For meaning of symbols, see Section A.

D. POLYMERIZABILITY OF 5-, 6- AND 7-MEMBERED HETEROCYCLIC RING COMPOUNDS

The free energy of polymerization is generally negative for 3-, 4-, 8-, and higher-membered ring compounds. With heterocyclic rings there is generally an ionic mechanism available which allows these compounds to polymerize. With 5-, 6- and 7-membered ring compounds the sign of ΔG, and hence the polymerizability, is critically dependent on the nature of the ring and on the extent and position of substitution. Substitution generally makes ΔG less negative (more positive) and reduces polymerizability in the thermodynamic sense.

Tables 12–14 summarize the polymerizability of 5-, 6- and 7-membered rings, respectively, as a function of the nature of the ring and extent of substitution. Table 15 provides a comparison of polymerizability of unsubstituted 5-, 6-, and 7-membered rings.

TABLE 15. COMPARISON OF POLYMERIZABILITY (+ OR –) OF UNSUBSTITUTED 5-, 6- AND 7-MEMBERED RING COMPOUNDS[a]

Type of ring		Name of 5-ring	5-Ring	6-Ring	7-Ring
1,3-C_nNO		2-Oxazolidinone	–	+	
1,3-C_nN_2		2-Imidazolidinone	+	–	+
1,2-C_nOS		1,2-Oxathiolane-2,2-dioxide	+	–	
1,3-C_nO_2		1,3-Dioxolane	+	–	+
		Ethylene carbonate	–	+	
1,2-C_nS_2		1,2-Dithiolane	+	+	+
C_nN		Pyrrolidine	–	–	+
		2-Pyrrolidinone	+	+	+
		Succinimide	–	–	+

Notes page II-406; References page II - 407

TABLE 15. *cont'd*

Type of ring		Name of 5-ring	5-Ring	6-Ring	7-Ring
		2-Pyrrolidinethione	−		+
C_nO		Tetrahydrofuran (oxolane)	+	−	+
		Oxolane-2-one (γ-butyrolactone)	+	+	+
		Oxolane-2,5-dione(succinic anhydride)	−	−	+
C_nS		Thiolan-2-one (γ−thiobutyrolactone)	−	+	+

[a] The formulae denote rings of any size. Thus in the first line 1,3C4NO is drawn as  and represents 
E. NOTES

N_1 Corrected for end-group effects.

N_2 Is assumed.

N_3 Partial allowance for unreacted monomer.

N_4 Semi-empirical values for a number of other olefins are given in Ref. 143.

N_5 Value given is for dilute solution. Values determined for complete range of composition; maximum (14.4) at 50 mol% monomer.

N_6 No allowance for unreacted monomer.

N_7 Strongly dependent on both monomer concentration and temperature.

N_9 Corrected for enthalpy of glassy state.

N_{10} $-\Delta S_{ss}$ assumed to be 120.3 J/K mol.

N_{11} Zero heat not necessarily in conflict with observed polymerizability below −40°C. Additional loss of free energy may be provided by the crystallization of the polymer.

N_{12} Polymer largely insoluble and remains in suspension.

N_{13} After correction for species in vapour other than formaldehyde.

N_{14} In the presence of a few per cent methylene chloride.

N_{15} From measurements in methylene chloride, benzene and 1,4-dioxane.

N_{16} From measurements in benzene.

N_{17} From measurements on vapor−solid equilibrium.

N_{18} From measurements in both methylene chloride and nitrobenzene.

N_{19} From measurements in 1,2-dichloroethane.

N_{20} Value calculated by the compiler of this table from data in Ref. cited.

N_{21} Numerical values for heats of copolymerization are listed only for those systems yielding 1 : 1 copolymers. The values refer to the copolymerization of 0.5 mol of each monomer. In all other cases listed the copolymers have a range of composition; details of the corresponding heats of copolymerization are given in the Ref. cited.

Where no solvent is specified in the seventh column, the symbol ΔH_{ss} denotes that the measured heat is for a liquid mixture of monomers going to a solution of copolymers. ΔH_{lc} denotes the heat change for pure liquid monomers going to condensed amorphous polymer. (This symbolism differs from that in Ref. 1.)

N_{22} The states of monomer and/or polymer are not stated in Ref. but are likely to be the ones given.

N_{23} Value calculated from measurements on mixtures containing excess B.

N_{24} Value calculated from measurements on mixtures containing excess A.

N_{25} Value in Ref. 11 corrected using entropy of monomer in Ref. 94.

N_{26} From measurements in both benzene and cyclohexane.

N_{27} Standard state: mol fraction of monomer = 0.1.

N_{28} After correction for species in vapor other than formaldehyde.

N_{29} Numerical values for entropies of polymerizaiton listed are for systems yielding 1:1 copolymers. The values refer to the copolymerization of 0.5 mol of each monomer. The symbolism and standard states are the same as used for the heats of copolymerization (see N_{21}).

N_{30} Value of $\Delta S°$ for the composition of polymer indicated.

N_{31} No allowance for free energy of mixing of polymer and monomer.

N_{32} Floor temperature (hypothetical for supercooled liquid).

N_{33} Floor temperature.

N_{34} Calculated value. Not measurable experimentally because of side reactions.

N_{35} Small amount of vapor dissolved in the polymer: approximately gc.

N_{36} Hypothetical value for acetone as a gas at 1013 mbar pressure.
N_{37} Decreases with increasing polymer concentration (Ref. 112,160,289).
N_{38} Recognised that polymerization over $WCl_6/EtAlCl_2/EtOH$ yields an equilibrium mixture of unsaturated cyclic rings $(C_8H_{14})_n$. Species up to $n = 15$ have been identified and higher cyclic polymers are also likely to be present. No firm equilibrium data exist as yet.
N_{39} $dT_c/dP = 19$ deg/kbar.
N_{40} Value in [*M*] column is the mol fraction of monomer.
N_{41} Decreases with increasing polymer concentration in methylene chloride, in benzene and in 1,4-dioxane (Ref. 159).
N_{42} K_n values determined for cyclic monomers, $n = 1-8$.
N_{43} Extrapolated value.
N_{44} For equilibrium concentrations of linear oligomeric species see Ref. 294.
N_{45} Note the substantial discrepancy between the two sets of results with nitrobenzene as solvent.
N_{46} Value in [*M*] column is the volume fraction of cyclic monomer (rings of all sizes).
N_{47} Concentration of rings, $n = 13-\infty$, taking mol. wt. = 74 (value for $n = 1$); K_n determined for cyclic monomers, $n = 3-400$.
N_{48} Corrected for isomerization effect.
N_{49} Uncorrected for isomerization effect.
N_{50} Equilibrium concentrations of A and B lower than expected from values for homopolymerizations.
N_{51} Polymer is $\text{-}[CONHN(COMe)]\text{-}$.
N_{52} Polymer is $\text{-}[CH_2CH_2N(COR)]\text{-}$.
N_{53} *cis* and *trans* forms of polymer.
N_{54} c′(I),c′(II),c(III) refer to crystal forms I, II, III of monomer.
N_{55} Standard state is 1M, calculated from data in Ref. 148.
N_{56} Polymer dissolved in monomer; equilibrium concentration in mol/L.
N_{57} T_c calculated from $\Delta H^\circ_{lc}/\Delta S^\circ_{lc}$ or $\Delta H^\circ_{ss}/\Delta S^\circ_{ss}$.
N_{58} Valid in concentration range 2.3 to 4.6 M.
N_{59} Corrected for monomer–polymer interactions; required temperature variable interaction parameter.
N_{60} Data from Ref. 292, with corrections for monomer adsorbed in polymer.
N_{61} lc data from Ref. 231 combined with vaporization data.
N_{62} Calorimetry in solution with adjustments for solution enthalpies.
N_{63} With heat capacity adjustment for *T* change: may apply to N_{62}.
N_{64} From group method calculations; ΔG° (298 K) value given in brackets in kJ/mol; T_c refers to standard state conditions, $p_A = p_B = 1$ atm.
N_{65} ΔH_p by method 4a in close agreement.
N_{66} Ring opening polymerization giving 78% *trans* polymer.
N_{67} Polymer is N_{68} Calculated from solution values with experimentally determined data.
N_{69} Calculated from solution data utilizing monomer-polymer interaction parameters, see Ref. 130.
N_{70} Mixture of 1,2 and 1,4 polymerization.
N_{71} Includes adjustment for the presence of small concentrations of other cyclics; $S_n \neq S_8$.
N_{72} Calculations based on standard enthalpies of formation of S_n and ΔH_p (S_8).
N_{73} Calculation based on standard entropies of S_n and ΔS_p (S_8).
N_{74} Values apply in temperature range below the appropriate ceiling temperature, see Section C, Table 10, under "Monomers Giving Polymers Containing O in the Main Chain, Bonded to C Only."
N_{75} Obtained by extrapolation of kinetic data.
N_{76} Ring opening at S–C bond.
N_{77} c′(I), c′(II) refer to crystal forms I, II of polymer.
N_{78} Average Temperature
N_{79} Polymer is N_{80} Polymer is N_{81} Polymer is N_{82} Polymer is

A. INTRODUCTION

The conversion of a free radical homopolymerization as a function of time is usually expressed by the following equation:

$$\frac{1}{1-x}\frac{\partial x}{\partial t} = k_{\mathrm{p}}\left(\frac{2fk_{\mathrm{d}}I}{k_{\mathrm{t}}}\right)^{0.5}$$

where x is the conversion, t the time, k_{p}, k_{t}, and k_{d} the propagation, termination and initiator decomposition rate constants, respectively, f the initiator efficiency and I the initiator concentration.

It is generally assumed that the temperature dependence of free radical polymerization rate constants can be expressed using the well-known Arrhenius equation:

$$k = A_0 \exp\left(\frac{-E}{RT}\right)$$

where A_0 is the frequency factor, R the universal gas constant, T the absolute temperature, and E the activation of the reaction in question. Measurement of k_{p} and k_{t} at different temperatures allows one to determine values of the activation energies of the same two reactions, E_{p} and E_{t}, respectively.

If we accept this representation, then the overall activation energy of a homopolymerization can be written as

$$E_{\mathrm{OV}} = E_{\mathrm{p}} - \frac{1}{2}E_{\mathrm{t}} + \frac{1}{2}E_{\mathrm{d}}$$

The value of the activation energy for the initiator decomposition reaction, E_{d}, can often be estimated separately. When data are not available for E_{p} and E_{t} as separate quantities, the term $\left(E_{\mathrm{p}} - \frac{1}{2}E_{\mathrm{t}}\right)$ can be used to model the polymerization reaction.

In the following tables, all energies are reported in terms of kJ/mol, and any appropriate remark(s) associated with the data are presented.

B. TABLES

TABLE 1. DIENES

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Butadiene	10.9			In gas phase	13
	38.9			In emulsion	14
	24.3 & 20.9			In gas phase	16
	20.5			In gas phase	21
	35.7	5.9		Solution polymerization in CCl_4; temperature range: 303–333 K	90
	38.9			For emulsion polymerization, supposing $\bar{n} = 0.5$	91
1,3-Hexadiene	8.42			Thermal and photoinitiation; temperature range: 278–333 K; k_p measured by ESR	92
Chloroprene	40.6			In emulsion	35
Dimethyl butadiene	37.7			In emulsion	45
Isoprene	46.0			In emulsion	15

TABLE 2. OLEFINS

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Acetylene	21.4			In gas phase	21
Ethylene	34.3			In gas phase	21
	18.4	1.3	17.8	Calculated using results of Ref. 24	35
	23.9			In gas phase	44
	46.4	33.5	29.7	High pressure in gas phase (up to 300 NPa); initiated by oxygen; temperature range: 60–250 °C; conversion found by gravimetry	73
			31.0	High pressure polymerization (up to 300 MPa); initiated by DTBPO; temperature range: 130–165 °C	82
	36.8	6.22			93
	29.7	10.0			94
	40.0	15.2		Activation volumes (cal/mol/atm): propagation: − 19.7, termination: 13.0	95
	25.1	− 1.59			96
	20.8	3.13			97
	29.7	10.0			98
	32.5	4.19			99
	36.9	1.05			100
	31.4			Estimation for simulation of emulsion copolymerization with vinyl acetate	101
		14.2			102
			31.6	Activation volume $= -26.2E \times 10^{-6}$ m^3/gmol	103
	30.3	4.2		Activation volume for propagation = − 0.5 cal/mol/atm	104
	17.6 ± 0.31	15.3 ± 0.26		Activation volumes (cal/mol/atm): propagation: − 16.8 ± 0.1; termination: 9.2.	105
	30.2	6.44		Optimized from values of industrial runs	106
Propene	23.4			In gas phase	21
Isoprene	41.0			In emulsion	15

TABLE 3. ACRYLIC DERIVATIVES

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Acrylamide					
A	11.7 ± 1.2	11.7 ± 0.8	5.8 ± 1.6	Solution polymerization in H_2O/DMSO	68
B	16.3 ± 0.8	10.9 ± 0.4	10.9 ± 1.3	mixture with potassium persulfate;	
C	18.8 ± 1.9	10.9 ± 0.4	13.4 ± 0.3	initiators: H_2O : DMSO : (A) 100 : 0	
D	20.5 ± 0.8	7.9 ± 0.4	16.9 ± 1.0	(B) 88 : 12	
E	25.1 ± 0.9	0 ± 0.8	25.1 ± 1.3	(C) 65 : 35	
				(D) 38 : 62	
				(E) 0 : 100	
	22 ± 0.2			pH 1	
	20 ± 0.2			pH 4	
	11.5	6.2		Compilation of data, validated for inverse suspension polymerization	111
	57.8	10.46		Compilation from various sources, validated for solution polymerization	112
N,N-methylene-bis-acrylamide			9.3	Aqueous polymerization with temperature range: 293–313 K	113
Acrylic acid					
			23.4	Initiation with APS; temperature range: 309.5–324.5 K; solution polymerization at pH_0 4.38	107
			21.7	Precipitation polymerization; temperature range: 313–333 K	108
			14.1		109
				By PLP; temperature range: 288–328 K	110
–, sodium salt	(1) 67.5 (2) 72.1			Thermally induced solid state polymerization; two methods to find E_p: (1) ESR, (2) DSC; temperature range: 60–160 °C	87
–, chromium salt			33.5	Polymerized with styrene–arsenic sulfide complex initiator in DMF	114
–, zinc salt			13.0	Initiated with an As2S3–styrene complex in DMSO at 363 K	115
–, butyl ester	8.8	0			8
	52.3	73.7		At 20% conversion	26
	15.5			From PLP–GPC; temperature range: (208–266 K); bulk polymerization	116
		38.1			109
	14 ± 6			From PLP; temperature range: (298–353 K); conversion range: (10–80%); bulk polymerization; $P = 1$ bar.	117
			$E_p - E_T = 0$	From PLP; conversion = 30% in bulk polymerization	118
	9.6 ± 0.56			By PLP–GPC; bulk polymerization with photoinitiators: benzoin and 2,2-dimethoxy-2-phenylacetophenone; temperature range: 298–303 K	119
–, ethyl ester	41	12.3			109
–, methyl ester	29.7	22.2			
	19.7	~0			
	31.8 ± 2.5	20.1 ± 0.8		Gamma ray induced solid state polymerization; temperature range: 243–283 K	
			40.7		109
–, 1,3-hydroxyneopentyl ester			31.8	Measured by dilatometry in both benzene and 1,4 dioxane ($k_p/k_t^{0.5}$ higher in dioxane)	120
–, methyl α-acetoxy ester	35.5	46.8		By ESR; temperature range: 303–333 K; solution polymerization in 1,1,2-trichloroethane; initiator: 2,2′-azobis(4-methoxy-2,4-dimethylvaleronitrile) (V-70)	121
–, methyl α-butoxy ester	30.5	25.1		By ESR; assuming $E_d = 109.5$; solution polymerization in 1,1,2-trichloroethane; initiator: 2,2′-azobis(4-methoxy-2, 4-dimethylvaleronitrile (V-70)	121
Acrylonitrile	17.2	22.6	5.9	In water solvent	25
	16.2	15.5	8.5	In DMF solvent	32

TABLE 3. *cont'd*

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Acrylonitrile (*cont'd*)	26.8	~0	6.8	In DMF solvent	37
			21.4		109
	29.6	7.0		Estimated from data on solution copolymerization with styrene as azeotrope	122
	42.7				123
			23.9	Polymerization in NaSCN solution with $Mn(C_5H_7O_2)_2$ as free radical initiator; temperature range: 295–313 K; value estimated from overall activation energy with $E_d = 58.6$ kJ/mol	124
D-Fluoroacrylic acid					
–, methyl ester			9.6	Solution: acrylonitrile; initiator: AIBN; (assume $E_d = 128$ kJ/mol)	71

TABLE 4. METHACRYLIC DERIVATIVES

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Methacrylamide	15.5	16.7	7.1	Solvent: water	34
	22.1			By PLP; temperature range: (288–328 K); pH 1	110
Methacrylic acid	17.7			By PLP–GPC; 33% monomer in methanol; temperature range: 293–333 K	125
	17.4				109
–, butyl ester	18.4	4.6	16.1	Gamma ray initiation	27
	20.4	12.7	14.1	Kinetics from calorimetry	55
	20.9	8.8	16.7	Temperature range: 35–27°C	Quoted in 58
–, butyl ester	21.8 ± 0.27			By PLP	131
	22.9 ± 1.1			By PLP–GPC; $P = 1000$ bars; temperature range: – 10 to 60°C	141
	23.3			Temperature range: 25–55°C; by PLP bulk polymerization; photoinitiator: benzoin	135
	20.4				126
	20.5 ± 0.24			By PLP–MWD; bulk polymerization; pressure: 1 bar; photoinitiator: benzoin	127
–, *i*-butyl ester	22.5 ± 0.42				131
	21.5 ± 0.35			By PLP–MWD; bulk polymerization; pressure: 1 bar; photoinitiator: benzoin	127
–, *t*-butyl ester	27.7 ± 2.5			Temperature range: 9–66°C; by PLP with benzoinethyl ether as free rapid initiator	128
–, chloromethyl ester			5.5	Ampoule and emulsion polymerization; AIBN initiator	78
–, cyanomethyl ester			~8.4	Solution: acetonitrile AIBN initiator calculated, assuming E_d of AIBN = 128 kJ/mol from overall activation energy; temperature range: 50–70 °C	87
–, dodecyl ester (lauryl ester)		15.5			Quoted in 58
			29.8	Bulk polymerization with BPO initiator; temperature range 60–80 °C; maximum conversion 1%	66
	21.5 ± 0.34			By PLP	131
	13.7				135
	16.2			By PLP–MWD; bulk polymerization; photoinitiator: benzoin	135
–, ethyl ester	23.2	8.9	18.0	Gamma ray initiation; temperature range: – 30 to 55 °C; kinetics from calorimetry	52
	21.3	7.1	17.7		Quoted in 58
			16.5	Data from bulk and solution (50% DMF); AIBN initiator; kinetics from GLC and gravimetry	63

TABLE 4. *cont'd*

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Methacrylic acid, ethyl ester (*cont'd*)	27.0	− 6.6	30.4		Quoted in 79
	22.8 ± 0.35			By PLP	131
	20.46			By PLP; temperature range: 298–328 °C; bulk polymerization; photoinitiator: benzoin	135
	27.0			Evaluated for emulsion polymerization	129
	22.9 ± 0.46			By PLP–GPC; bulk polymerization, pressure: 1 bar; photoinitiator: benzoin	127
			22.2	Bulk polymerization; initiator: AIBN	130
			16.3	Solution polymerization in benzene; initiator: AIBN	130
–, hexadecyl ester	20.1	18.8	10.5		Quoted in 58
–, hexyl ester	18.0		~ 8.4		Quoted in 58
–, methyl ester	26.4	11.9	20.5		4
	18.4	0	18.4		7
	24.3	2.1	23.2		28
	20.9	0–16.7	20.9–12.6	Termination by combination or disproportionation	30
	18.8				47
	22.4			In emulsion	31
	22.8	13.2	11.2	Gamma ray induced; temperature range: − 25 to 55 °C; used a combination of DCS and inhibition with DPPH to find kinetic parameters	48
				Polymerization in benzene; DMDM initiator; temperature range: 50–80 °C	49
	22.6 ± 2.5	Tends to 0	22.6 ± 2.5	Bulk polymerization; DBPO initiator; maximum conversion 25%; ESR used to find kinetic parameters	53
			13.0	Isothermal bulk; polymerization with AIBN initiator; DCS used to follow reaction; value found assuming E_d AIBN = 128 kJ/mol	56
	19.7	3.3	18.0		Quoted in 58
	18.2 ± 0.2	2.9 ± 0.0	16.7 ± 0.2	Bulk polymerization; AIBN initiator temperature range 15–30 °C; reaction followed by spatially intermittent polymerization; DP 10000–15000	64
			23.4	Bulk polymerization; AIBN initiator; 1-butanethiol used as CTA; value assumes E_d AIBN = 128 kJ/mol	65
	20.4	~ 10.5	15.1	Solution: benzene; AIBN initiator; kinetic data from molecular weight data; maximum conversion 5%	68
	29.1			Emulsion data; particle sizes from turbidity; potassium persulfate initiator	72
	20.9 ± 3.3	1.6 ± 0.4	20.1 ± 3.6	Solution: benzene; AIBN initiator; kinetic parameters from intermittent illumination	77
	31.3			Bulk polymerization	85
	21.3 ± 0.25			By PLP	131
	18.2				132
	26.4	11.7			133
			3.55		109
	22.6	0 ± 2.5		Temperature range: 293–353 K	156

–, *p-tert*-butylphenyl ester			9.5		147
–, ethyl α-Benzoyloxymethyl ester			11.5	By ESR, assuming E_d = 129; solution polymerization in benzene; initiator: AIBN	148
–, ethyl α-acetacetoxymethyl ester			24.55		149
–, 2-(3-chloro-3-methylcyclobutyl)-2-hydroxyethyl ester			30.68	Polymerization in dioxane using Bz_2O_2 as initiator	150
Methacryloyl fluoride			10.4	Solution: MEK; AIBN initiator; calculated using E_d AIBN = 128 kJ/mol; temperature range: 50–70 °C	81
Methacrylonitrile	48.1	20.9	37.7		20
	29.7 ± 1.5			By PLP; solution polymerization in benzylactone; temperature range: 283–333 K	151
–, *n*-Phenyl-α-methylene-β-lactam			22.8	Solution polymerization in *n*-methyl-2-pyrrolidone with AIBN (calculated from E_{OV} assuming E_d of AIBN = 129 kJ/mol)	152

TABLE 5. VINYL HALOGENS

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Tetrafluoroethylene	17.4	13.6	10.6		46
	5.4	0.8	5.0		43
Vinyl bromide	30.0	16.3	21.8		42
Vinyl chloride	16.0	17.6	7.4		17
			12	Validated for model of suspension polymerization	153
	27.6	18.2		For suspension polymerization	154
Vinylidene chloride	104	167	20.5	Solvent: hexane	9
	37.7 ± 5.9	20.9 ± 10.5	27.2 ± 11.1	Solution: *N*-methylpyrrolidone; AIBN used as photoinitiator; most runs ≤ 1% conversion	67

TABLE 6. VINYL ETHERS AND VINYL ESTERS

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Butyl vinyl ether			46.4	Bulk polymerization; initiator DTBPO; assume E_d = 51.5 kJ/mol (Ref. 82) at given conditions; GPC data used to find kinetic parameters	84
Vinyl acetate	18.0	0	18.0		1
	30.6	21.9	19.6		5
	13	0	13		6
	18	<4	16–18		18
	18	0	0		22
	39 ± 3				38
	19.6 ± 2.9	0	19.6 ± 2.9	Bulk polymerization; DBPO and cyclohexyloxyperoxide initiators; ESR used to find kinetics	53
			~26.4	Bulk polymerization; DBPO and cyclohexyloxyperoxide initiators; temperature range: 55–70 °C; DSC used for kinetics; maximum conversion 20%	57
	20.5 ± 0.39				131
	26.4	11.7			133
	23.5			Validated for emulsion copolymerization with ethylene; temperature range: 293–323 K; pressure range: 0–34 bar	102
		14.2			155
			28.1		109
	19.7 ± 2.9	0		Temperature range: 293–353 K	156
	23.7			For emulsion polymerization	157
	23.6			Emulsion polymerization	158
	24.2	4.0			159
	26.4	13.4			160
	35.2	14.2		Rotating-sector method; bulk polymerization; photoinitiator: benzoin	155
	27.8			By PLP–MWD; bulk polymerization; photoinitiator: benzoin	161

TABLE 7. STYRENE AND DERIVATIVES

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Styrene	49.0			In emulsion	2
	27.2 ± 4.2	11.7 ± 4.2	21.3 ± 6.3		3
	26.0	8.0	22.0		10
	32.5	9.9	27.5		11
	31.0 & 35.0			In emulsions	15
	54.0 & 59.0			In emulsions	19
	25.0	2.0	24.0		29
	73.6				36
	29.0				42
			25.1	Gamma ray induced; bulk liquid phase polymerization; maximum conversion 10%; temperature range: 19–74 °C	50
	37.7			Low conversion; bulk polymerization; ESR spectroscopy used for kinetics	51
	29.5 ± 0.1	9.2 ± 0.5	24.9 ± 0.4	Bulk photopolymerization; kinetics from spatially intermittent polymerization technique; temperature range: 15–36 °C DP 2400–2700	64
			34.1	AIBN initiator; assume E_d = 128 kJ/mol; bulk polymerization 1-butanethiol as CTA; maximum conversion 0.4%	65
	29.0 ± 3.0			In emulsion; reaction followed by dilatometry	70

References page II - 424

Table 7. *cont'd*

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
	32.2			Emulsion data; assume $N = 0.5$, sodium persulfate and sodium bisulfite initiators	76
	32.5	14.5	25.2	Bulk polymerization; AIBN initiator; temperature range: 45–100 °C	79
	17.7			In emulsion; sodium persulfate initiator	89
	29.6				132
			25.2		109
	37.8 ± 1.7				156
	39.8	15.6		By ESR; temperature range: 273–403 K	162
	36.1	18.7		Suspension polymerization; conversion less than 0.8; temperature range: 283–353 K	163
	29.5			Spatially intermittent polymerization/emulsion polymerization	164
	44.4	36.4		High conversion suspension polymerization	165
	29			Emulsion polymerization; temperature range: 318–338 K	166
	37.5 ± 1.6	10.91		ESR; temperature range: 323–363 K	167
	30.8			By PLP; temperature range: 298–328 K	168
				By PLP; temperature range: 293–353	169
	30.0			For d_p (degree of polymerization) >4	
	29.0			For all chain lengths together	
			32.3	Bulk and diluted systems initiated by (*p*-acetylbenzylidene)triphenylarsonium	170
				Measurements by rotating sector method; initiators: AIBN (30–50 °C), BPO (70–90 °C)	171
	31.5	9.5		Styrene	
	31.5	14.2		Perdeuterated styrene	
	31.5			PLP; temperature range: 303–363 K; in bulk	172
	18			Measurments by ESR; photo and thermal initiation; temperature range: 293–363 °C	173
	32.5			PLP; temperature range: 261–366 K; bulk polymerization with photoinitiators: benzoin and 2,2-dimethoxy-2-phenylacetophenone (DMPA)	174
p-Bromostyrene	32.0				39
o-Methylstyrene	58.2			In emulsion	36
p-Methylstyrene	32.0			In emulsion	36
			25.4		109
	29.6	30.5			175
	29.6	8.27			176
α-Methyl styrene	54.3	8.4			177
Divinylbenzene	35.5	29.8		Searched by EVM	178

TABLE 8. VINYL HETEROAROMATICS

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
3-Methylene-5,5-dimethyl-2-pyrrolidone			8.2	Solution polymerization in DMSO with AIBN (calculated from E_{OV} assuming E_d of AIBN = 129 kJ/mol)	179
Methylene-*N*-methylpyrrolidone			20.1	In bulk and in solution with acetonitrile; AIBN initiator (assume E_d = 128 kJ/mol)	86
N-Vinylcarbazole	28.9				42
2-Vinylpyridine	33.5	20.9	23.0		40
N-Vinylpyrrolidone	29.7	6.7	26.4	Low conversion	41
(A)	68.0	19.0	58.5	In various solvents: (A) Water	61
(B)	40.0 ± 2.0	13.0	33.5 ± 2.0	(B) L-Propanol	
(C)	31.6 ± 3.0	9.0	27.5 ± 3.0	(C) Methanol	
(D)	23.0	8.0	19.0	(D) Ethyl acetate; rates followed by dilatometry	

Table 8. *cont'd*

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
			4.8	Template polymerization in DMF; AIBN initiator; DSC used to follow reaction	74
			(1) 12.8	Solution polymerization	75
			(2) 10.8	In DMF; assume E_d of AIBN in DMF = 142 kJ/mol; reaction followed by DSC in 2 modes: (1) dynamic (2) isothermal	
			65.8 ± 0.1	Aqueous phase polymerization with potassium peroxydiphosphate Ag^+; temperature range: 293–323 K	180
	29.7	6.7			181
4-Methylene-4H-1,3-benzodioxin-2-one			11.2	Solution polymerization in *n*-methyl-2-pyrrolidone with AIBN (calculated from E_{OV} assuming E_d of AIBN = 129 kJ/mol)	182

TABLE 9. MISCELLANEOUS COMPOUNDS

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
Acetaldehyde	46.0 ± 6.3			Radiation induced in solid phase; calorimetry used to follow reaction; temperature range: 130–150 °K	54
Diethyl fumarate			25.0 ± 2.0	Bulk polymerization; AIBN initiator; (assume E_d = 128 kJ/mol) dilatometry used to follow the reaction; temperature range: 60–80 °C	59
			26.5	Assuming E_d = 129; by dilatometry; bulk polymerization; initiator: AIBN	183
Diisopropyl fumarate	16.8	16.3			184
Formaldehyde	8.4				Quoted in 54
D-Methylene-γ-butyrolactone			12.1	Solution: DMF; AIBN initiator (assume E_d = 128 kJ/mol); $E_p - E_t \approx 12.1$	80
Vinylferrocene	20.0	7.9		Note nonclassical kinetics; overall activation energy does not equal $E_d + E_p - E_t/2$; can approximate E_t = that of styrene	62
N-Vinyl-methylacetamide			26.9	Solution: methanol; AIBN initiator; maximum conversion 10%; temperature range: 25–75 °C	83
α-Ethyl, β-hexafluoroisopropyl itaconate	18.0	57.4		Polymerization in benzene catalyzed by dimethyl 2,2-azobisisobutyrate	185
Diethyl itaconate				Polymerization in benzene catalyzed by dimethyl 2,2-azobisisobutyrate	186
	29.0	30.0		(no $SnCl_4$)	
	21.0	24.0		(0.342 mol/l $SnCl_4$)	
Diisopropyl itaconate	28.5	66.1		Polymerization in benzene catalysed by dimethyl 2,2-azobisisobutyrate	187
Di-*n*-Butyl itaconate (DBI)			0.5	Assuming E_d = 129; by ESR; solution polymerization in benzene; initiator: AIBN	188
			4.35	Assuming E_d = 129.1; By ESR; solution polymerization in benzene; initiator: 2,2′-azobis(isobutyrate): MAIB	188
1,1-bis[(1-adamantyloxy)carbonyl]-2-vinyl-cyclopropane			87.1	Ring-opening solution homopolymerization in benzene; temperature range: 323–343 K; with AIBN (assume $E_{D,AIBN}$ = 123.5 kJ/mol)	189
Diethylene glycol bis-allyl carbonate (DEAC)	53.6			Rotating sector method; Initiator: BPO	190
N-Acryloyl-2,2-dimethyl-5®-phenyl-1,3-oxazolidine (ADPO)	29	21		Assuming E_d = 124.3; temperature range: 323–343 °C; solution polymerization in benzene; initiator: 2,2′-azobis(isobutyrate): MAIB	191

Table 9. *cont'd*

Monomer	E_p	E_t	$E_p - \frac{1}{2}E_t$	Remarks	Refs.
N-Cyclohexylmaleimide (CHMIm)	40.9	20.1		By ESR; temperature range: 313–333 K; solution polymerization in benzene; initiator: AIBN	192
N-Acryloyl-*p*-aminobenzoic acid			48.3	Assuming $E_d = 129$; solution polymerization in dioxane; initiator: AIBN	193

A. INTRODUCTION

The activation volume is included in the pressure dependence of the reaction rate constant (1–4):

$$\left(\frac{\partial \ln k}{\partial p}\right)_T = -\frac{\Delta v^*}{RT} + \frac{1}{V}\left(\frac{\partial v}{\partial p}\right)_T \quad (A1)$$

where k is the reaction rate constant, p is the pressure, T, the temperature V, the volume, and Δv^*, the activation volume (analogous to the activation energy). It is the difference between the partial molar volume of the activated complex, as formed in the transition state theory by the efficient collision of molecules, and those of the initial reactants. The sign of the activation volume depends on the type of the chemical reaction. If new bonds are formed in the transition state, the activated complex is larger than the initial species, and hence the activation volume is positive. Inversely the activation volume is negative if bonds are stretched and broken.

For a rough calculation of the activation volume, we can assume that the formation of new bonds as well as stretching occurs along the axis of a cylinder, whose constant cross section is determined by the van der Waal's radii $d_{mA/2}$, $d_{mB/2}$, and $d_{mC/2}$ of the atoms A, B, C:

$$\Delta v^* = \frac{\pi}{8} N\left[(d_{mA}^2 + d_{mB}^2)(\Delta_{AB}) + (d_{mB}^2 + d_{mC}^2)(\Delta_{B,C})\right] \quad (A2)$$

with $\Delta_{AB} = (0.10\text{–}0.35)\, d_{mAB}$, $\Delta_{B,C} = (1.10\text{–}1.35) d_{mBC} - d_{mB,C}$ (see Refs. 2,5,6), N is the Avogadro number, d_{mAB}, d_{mBC} = bond length (values, see Ref. 7), and d_{mBC} is the interatomic distance at the minimum of potential (sum of van der Waal's radii), $d_{mA/2}$, $d_{mB/2}$ (see Ref. 8).

The stretching of the bonds in the transition state is about 0.01–0.1 nm, whereas the change in the distance $d_{mB,C}$ between the unbonded atoms is usually larger (up to 0.25 nm).

If the decomposition of the activated complex causes only small changes in the bond length or in the distance between the atoms, its partial molar volume differs from that of the activated complex only slightly. Hence we can assume

$$\Delta v^* \cong \Delta v$$

where Δv is the excess of the partial molar volume of the reaction products over the partial molar volumes of the initial species.

This simplification is valid for reactions in which products of cyclic structure are formed, as in the dimerization of cyclopentadiene, with $\Delta v^* \approx \Delta v = -30\,\text{cm}^3/\text{mol}$ (9, 10).

*Table 3. Activation Volumes.

A second term is added to the volume change of the reacting molecules in the transition state if a polar solvent is involved. This term takes into account the change in the packing density of the surrounding solvent molecules due to the arising or disappearing of electrostatic charges between the solvent and the reactant species. This volume change is negative in bimolecular association and positive in unimolecular dissociation and tends therefore to counteract the effect of volume change during the reaction. The activation volume can be determined according to Eq. (A1) from rate measurements at different pressures and constant temperature using a semilog plot of reaction rate constant versus pressure. In this evaluation the value of $(\partial V/\partial p)_T/V$ can often be neglected, because the compressibility of fluid reactants and compressed gases is generally small at pressures above 100–200 MPa.

At very high pressures the increase of the reaction rate constant at negative activation volume is retarded by the lower mobility of the molecules due to the increased viscosity. This effect was first measured by Hamann (11) in an examination of the alkaline etherification of ethyl bromide at pressures up to 4000 MPa. It was also found in the polymerization of styrene by Nicholson and Norrish (12).

In order to obtain the reaction rate as an explicite function of pressure, Eq. (A1) can be integrated, neglecting the compressibility and assuming that the activation volume does not change greatly with pressure (13):

$$k_p = k_0 \times \exp - \frac{\Delta v*}{RT}(p - p_0) \qquad \text{(A3)}$$

where k_p is the reaction rate constant at pressure p and k_0 is the reaction rate constant at reference pressure p_0.

According to Eq. (A3) the reaction rate constant increases exponentially with pressure if the activation volume is negative and decreases if Δv^* is positive. Eq. (A3) is valid only in the high pressure range ($p > 50$ MPa). At low pressures the compressibility cannot be neglected anymore, and the activation volume changes noticeably with pressure, especially in the neighborhood of the critical point. Simmons and Mason (14) studied the dimerization of chlorotrifluoroethylene at pressures up to 10 MPa. They found that the value of the negative activation volume decreases first with pressure and then increases rapidly. It has a maximum at the critical point and after decreasing again it approaches asymptotically a constant value.

The authors describe the pressure dependence of the rate constant, taking account of the partial molar volume of the initial reactants as well as that of the activated complex by the use of suitable equations of state (e.g., Redlich–Kwong or virial coefficient equations).

In order to appreciate the influence of pressure on the reaction rate constant one can compare it with the influence of the temperature: an increase in pressure (activation volume $\Delta v^* = -25\,\text{cm}^3/\text{mol}$) at a temperature of 50°C from 0.1 to 450 MPa corresponds to a temperature increase (activation energy $E = 84$ kJ/mol) from 50 to 105°C.

Experimentally determined overall activation volumes of some polymerization reactions are listed in Section B. The data were determined from the dependence of the overall rate constant of the polymerization reactions on pressure. The values are more or less negative, hence the rate of polymerization increases with pressure.

The overall activation volume is composed of the activation volumes of the different polymerization steps, initiation, or initiator decomposition, chain propagation and chain termination:

$$\Delta v^* = \Delta v_\text{p}^* + \Delta v_\text{d}^*/2 - \Delta v_\text{t}^*/2 \qquad \text{(A4)}$$

where Δv_p^* is the activation volume of chain propagation, Δv_d^* is the activation volume of initiation with respect to initiator decomposition, and Δv_t^* the activation volume of chain termination.

The activation volumes of initiator decomposition (values in Section C) are always positive because this reaction is a unimolecular dissociation, in which a bond (e.g., the O–O bond in peroxides and peresters or the N–N bond in azo-compounds) is stretched in the transition state and finally broken. As mentioned before, Δv_d^* depends on the solvent. It can significantly be influenced by a change of electrostatic charges, viscosity, and cage effects. The activation volume of initiator decomposition is different when induced decomposition is involved at high concentration of the initiator or when the initiator decomposes in a concerted mechanism. Δv_d^* is small for two-bond scission initiators (15). The activation volume is higher for one-bond scission initiator, bulky molecules, and when more bonds brake simultaneously. The data collected in Section C were obtained in separate measurements, observing the decrease of the initiator concentration with time at different pressures. The disappearance of the initiator can also be measured during polymerization by observing the light absorption at a characteristic waver length or using scavenger techniques.

In the chain propagation reaction, the decrease in the distance between the radical and the monomer molecule is greater than the increase in length of the double bond of the monomer. Hence the activation volumes Δv_p^* listed in Section D are always negative. The data for Δv_p^* are measured at high pressures by the method of the rotating sector together with Δv_t^*, the activation volume of chain termination.

The activation volumes Δv_t^* are also negative as shown in Section E. Mostly the termination reactions are diffusion-controlled. The reactant molecules undergo translational diffusion at first to form a collision pair. It follows the movement of the reactive sites on these molecules into a position favorable to chemical reaction. This process has been considered to be the rate-determining step. The activation volume involved in this so-called segment diffusion is observed. When chain termination is governed by translational diffusion, the activation volume, Δv_vis^* for viscous flow, is the key parameter for the evaluation of the influence of pressure.

The chain transfer of a radical to the monomer, to a "dead" polymer, or to a modifier molecule is mostly favored by the pressure which means that the activation volumes should be negative, whereas the activation volume of the intramolecular transfer (by "back biting"), which initiates the formation of short side chains, can be negative or positive. The activation volumes of these reactions are determined from the change in short- and long-chain branching or from the change of the average molar mass or degree of polymerization of the formed polymers with pressure.

Under the assumption that the monomer and the polymer concentration do not change over a wide range and that the temperature is kept constant, the following relation can be derived from kinetic considerations:

$$\Delta v_p^* - \Delta v_{tr}^* = RT\left(\frac{\partial \ln \mathrm{VZG}}{\partial p}\right)_T \qquad (A5)$$

where VZG is the number of branches and Δv_{tr}^* is the activation volume of the chain transfer reaction.

Analogously, the influence of the pressure on the chain transfer to a modifier can be described by the expression

$$\Delta v_p^* - \Delta v_{tr}^* = RT\left(\frac{\partial \ln(k_{tr}/k_p)}{\partial p}\right)_T = RT\left(\frac{\partial \ln(1/\bar{P} - 1/\bar{P}_{no})}{\partial p}\right)_T \qquad (A6)$$

where P is the average degree of polymerization obtained in the presence of a transfer agent and $\bar{P}_{no}$ is the average degree of polymerization obtained in the absence of a transfer agent.

Because of the mostly negative sign of the activation volumes (listed in Section F), the radical transfer to the modifier molecule is often slightly decreased at high pressures.

The activation volume of degradation reactions which can occur at high temperatures should be positive because bond cleavage increases the volume of the activated complex more than the formation of double bonds from single bonds decreases it.

The difference in the activation volumes of the various component reactions results in a different influence of the pressure on the rate constants and leads to modified polymers. Because of its larger negative activation volume the chain propagation reaction is more favored by high pressures than the termination. The chain length and consequently the tensile strength as well as the tensile modulus increase with pressure:

$$\left(\frac{\partial \ln \nu}{\partial p}\right)_T = -\frac{1}{RT}\left[\Delta v_p^* - \frac{1}{4}(3\Delta v_p^* + \Delta v_{td}^*\right] \qquad (A7)$$

where ν = chain length.

The small negative activation volume of the intramolecular chain transfer shows that this reaction step, which determines the short chain branching, is less favored by high pressures, which means that polymers with high density and crystallinity can be synthesized at high pressures.

Similar considerations also show that the composition of copolymers and thus their molecular structure is influenced by the synthesis pressure. The pressure dependence of the copolymerization parameters r_1 and r_2, which determine the composition of a copolymer, is expressed by the relationship

$$\left(\frac{\partial \ln(r_1/r_2)}{\partial p}\right)_T = -\frac{1}{RT}(\Delta v_{p11}^* - \Delta v_{p12}^* - \Delta v_{p22}^* + \Delta v_{p21}^*) \approx -\frac{1}{RT}(\Delta v_{p11}^* - \Delta v_{p22}^*) \qquad (A8)$$

where Δv_{p11}^*, Δv_{p22}^* are the activation volumes of the propagation reaction between a monomer molecule and a radical formed from the same monomer, and Δv_{p12}^*, Δv_{p21}^* are the activation volumes of the propagation reaction between a monomer molecule and a radical formed from the comonomer.

Equation (A8) is valid if the composition of the initial reaction mixture does not change appreciably with pressure. According to Eq. (A8), an increase in pressure favors the inclusion of monomers, which in homopolymerization show a large negative activation volume (e.g., substituted olefins). Values of copolymerization parameters obtained at different pressures and activation volumes of some copolymerization reactions are listed in Section G.

When r_1 and r_2 should be calculated for high-pressure copolymerization, following Alfrey and Price, the pressure dependence of Q, e data must be taken into account. Some values of Q and e for high pressures are collected in Section G. The dependence of the e data of two monomers on pressure is given by the equation

$$\left(\frac{\partial\left[-(e_1 - e_2)^2\right]}{\partial p}\right)_T = -\frac{1}{RT}[(\Delta v_{p11}^* - \Delta v_{p12}^*) + (\Delta v_{22}^* - \Delta v_{21})] \qquad (A9)$$

B. ACTIVATION VOLUMES (cm^3/mol) OF SOME POLYMERIZATION REACTIONS

Indene	0.30 (0.36)	0.28	– 1.10 (– 1.03)	– 1.05	111,108
Isobutylene	0.025 (0.029)	0.022	– 1.72 (– 1.06)	– 1.25	112
Isopropenyl acetate	0.08 (0.02)	0.12	– 1.30 (– 0.34)	– 1.60	105
Methyl acrylate	0.44 (0.44)	0.44	+0.60 (0.60)	+0.60	105
Methyl methacrylate	0.63 (0.74)	0.63	– 0.20 (0.38)	– 0.05	108,25
α-Methylstyrene	1.40 (1.00)	1.65	– 1.30 (– 1.27)	– 1.40	105
Methyl vinyl ketone	1.07 (0.65)	1.03	+0.95 (1.11)	+ 1.15	105
Propylene	0.010 (0.008)	0.015	– 1.50 (– 2.20)	– 1.05	112
Styrene	1.20 (1.00)	1.35	– 1.10 (– 0.80)	– 1.22	105,108,92
Vinyl acetate	0.06 (0.03)	0.05	– 0.20 (– 0.22)	– 0.35	105,108,110
Vinyl chloride	0.0450 (0.056)	0.045	+0.16 (0.20)	+0.19	112,41
Vinyl pivalate	0.023 (–)	0.046	– 0.19 (–)	– 0.02	113
2-Vinylpyridine	1.05 (1.03)	0.95	– 0.60 (– 0.50)	– 0.50	105
Vinylidene chloride	0.27 (0.26)	0.24	+0.42 (0.40)	+0.43	108

[a]Reference monomer is methyl acrylate (105).
[b]Values in parentheses refer to the values of styrene.

A. INTRODUCTION

In free radical polymerization, the tacticity of the resulting polymer depends on the propagation step, i.e., on stereocontrol by the propagating end. The following simple cases exist:

(a) The last monomeric unit does not control the stereospecificity of the propagation step. Isotactic (i) and syndiotactic (s) additions thus exhibit the same conditional probabilities ($p_i = p_s$). The mole fractions x of the resulting isotactic and syndiotactic diads are equal ($x_i = x_s$). If all steps occur at random, the four conditional probabilities for the formation of triads are equal ($p_{i/i} = p_{i/s} = p_{s/i} = p_{s/s}$), and so are the conditional probabilities for the formation of tetrads, pentads, etc. The resulting polymer is a true atactic polymer. It follows that

$$p_i = x_i = 1/2 \qquad p_s = x_s = 1/2 \tag{A1}$$

$$x_{ii} = x_{is} = x_{si} = x_{ss} = 1/4 \tag{A2}$$

(b) The last monomeric unit of the chain, but not the last diad, controls the propagation step. The probabilities for the formation of isotactic and syndiotactic diads are thus different ($p_i \neq p_s$). The process is Bernoullian (zeroth order Markov statistics) with respect to the formation of diads. Consequently, the probability of forming an isotactic diad at an existing isotactic diad equals the probability of forming an isotactic diad at an existing syndiotactic diad ($p_{i/i} = p_{s/i}$), and, by analogy, $p_{s/s} = p_{i/s}$. It follows for the diads (6,8)

$$p_i = x_i \neq 1/2 \qquad p_s = x_s \neq 1/2 \tag{A3}$$

and for the triads

$$x_{ii} = p_i^2 = x_i^2 \qquad x_{ss} = p_s^2 = x_s^2 \tag{A4}$$

$$x_{ht} = p_i p_s + p_s p_i = 2x_i x_s = 2x_i(1 - x_i) \tag{A5}$$

where x_{ii} is the mole fraction of isotactic triads and x_{ss} is the mole fraction of syndiotactic triads. x_{ht} is the mole fraction of heterotactic triads, regardless of whether formed by the formation of an isotactic unit at a syndiotactic one (conditional probability $p_{s/i}$) or vice versa (conditional probability $p_{i/s}$).

(c) The last two monomeric units of the chain, i.e., the last monomeric diad, regulate the stereocontrol of the propagation step. The four conditional probabilities do not equal each other ($p_{i/i} \neq p_{i/s} \neq p_{s/i} \neq p_{s/s}$). The mole fractions of isotactic (x_{ii}), syndiotactic (x_{ss}) and heterotactic triads (x_{ht}) are thus given by (8,11)

$$x_{ii} = x_i\, p_{i/i} \qquad x_{ss} = x_s\, p_{s/s} \tag{A6}$$

$$x_{ht} = x_i\, p_{i/s} + x_s p_{s/i} \tag{A7}$$

This process corresponds to a Markov trial of first order.

(d) Second order Markov statistics are present if the last two diads (i.e., the last triad or the last three monomeric

units) control the propagation step. In this case

$$x_{iii} = x_{ii}p_{i/i} \qquad x_{sss} = x_{ss}p_{s/s} \tag{A8}$$

$$x_{iis} = x_{ii}p_{i/s} \qquad x_{ssi} = x_{ss}p_{s/i} \tag{A9}$$

$$x_{iss} = x_{is}p_{s/s} \qquad x_{sii} = x_{si}p_{i/i} \tag{A10}$$

$$x_{isi} = x_{is}p_{s/i} \qquad x_{sis} = x_{si}p_{i/s} \tag{A11}$$

In order to distinguish between Markov second order and Markov first order mechanisms, at least tetrads must be known.

The probability of the addition of a 'b' diad (b = i, s) to an existing end 'a' (a = i, s) is given by the corresponding rates R:

$$P_{a/b} = \frac{R_{a/b}}{R_{a/a} + R_{a/b}} \tag{A12}$$

with a = i, s or b = i, s, in the Markov first order case, or a = ii, is, si, ss b = ii, is, si, ss, in the Markov second order case.

Using these definitions and assuming steady states and the equality of instantaneous and final diad and triad fractions, one can express ratios of all diads, triads, and tetrads in terms of rate constants (Table 1) or ratios of rate constants in terms of diad, triad, etc. fractions (Table 2). The rate constants themselves can be calculated if the rate constants of propagation are known for the corresponding experimental conditions (1).

From the temperature dependence of the expressions given in Table 2, differences in activation enthalpies ($\Delta H A^{\ddagger} - \Delta H^{\ddagger}_{B}$) and differences in activation entropies ($\Delta S^{\ddagger}_{A} - \Delta S^{\ddagger}_{B}$) can be calculated:

$$\frac{k_A}{k_B} = \exp\left(\frac{\Delta S^{\ddagger}_{A} - \Delta S^{\ddagger}_{B}}{R}\right)\exp\left(\frac{\Delta H^{\ddagger}_{A} - \Delta H^{\ddagger}_{B}}{RT}\right) \tag{A13}$$

The quantities ($\Delta H^{\ddagger}_{A} - \Delta H^{\ddagger}_{B}$) and ($\Delta S^{\ddagger}_{A} - \Delta S^{\ddagger}$) may reflect activation parameters (2,3), conformation parameters (4,5), or combinations thereof.

Table 3 gives the difference $\Delta\Delta H^{\ddagger} = \Delta H^{\ddagger}_{A} - \Delta H^{\ddagger}_{B}$ and $\Delta\Delta S^{\ddagger} = \Delta S^{\ddagger}_{A} - \Delta S^{\ddagger}_{B}$ calculated from the temperature dependence of diad ratios x_i/x_s. In the case of Bernoulli trials, they represent $\Delta H^{\ddagger}_{i} - \Delta H^{\ddagger}_{s}$ and $\Delta S^{\ddagger}_{i} - \Delta S^{\ddagger}_{s}$, respectively. For first order Markov trials, they stand for $\Delta H^{\ddagger}_{s/i} - \Delta H^{\ddagger}_{i/s}$ and $\Delta S^{\ddagger}_{s/i} - \Delta S^{\ddagger}_{i/s}$, respectively. In general, both $\Delta\Delta H^{\ddagger}$ and $\Delta\Delta S^{\ddagger}$ depend on the solvent (9,10), and consequently on the monomer/solvent ratio (11,12), but they are nearly independent of monomer conversion.

Table 4 gives the differences in activation enthalpies for modes of addition other than s/i vs. i/s, and Table 5 gives the corresponding differences in activation entropies. Only a few of these activation parameters could be calculated from literature data as very few triad fractions have been reported.

For any two modes of addition, the compensation effect between $\Delta\Delta H^{\ddagger}$ and $\Delta\Delta S^{\ddagger}$ (10,12,43) for the polymerization of a given monomer, in different solvents and/or at different monomer/solvent ratios, can be described by

$$\Delta H^{\ddagger}_{A} - \Delta H^{\ddagger}_{B} = \Delta\Delta H^{\ddagger}_{0} - (\Delta S^{\ddagger}_{A} - \Delta S^{\ddagger}_{B})T_0 \tag{A14}$$

The compensation temperature T_0 has been found to be independent, of the mode of addition (e.g., $A = i/i$ vs. $B = i/s$) within the limits of error (12,43). However, the compensation enthalpy $\Delta\Delta H^{\ddagger}_{0}$ depends on the mode of addition.

A. INTRODUCTION

Polymer degradation is a complex phenomenon, and the nature of the chemistry occurring during thermal decomposition can be difficult to determine precisely. The observed products of degradation can be the result of a mixture of primary, secondary or even tertiary decomposition processes, and as a consequence, the distribution of products will depend on such factors as sample thickness and melt viscosity, in addition to the more obvious factors such as temperature, atmosphere and the chemical structure of the polymer itself. It is often overlooked that abnormal structures (terminal unsaturation, head-to-head structures, peroxide links etc.) can also markedly effect polymer stability and product distribution.

Products are of three types. Firstly, there are the volatile small molecules (typically of the size of monomer or smaller) which are fairly readily separated and characterized. Secondly, there are the larger molecules that represent fragments of the chain. These species are volatile at the degradation temperature but condense outwith the degradation zone. Generally produced as a complex spectrum of oligomers, these fragments are more difficult to separate and characterize in detail, particularly as internal rearrangements of the backbone often occur before and during fragmentation. In many cases, identification is limited to key functionalities but the advent of sophisticated chromatographic and mass spectrometric techniques is leading to increasingly detailed analyses. In particular, the smaller fragments such as dimer and trimer are in principle more readily fully characterized than the larger fragments; nevertheless there often remains some uncertainty, particularly in relation to end groups. The most intractable product is the third type, the residue, which is often (but not always) insoluble, and characterization may again be limited to identification of key functionalities.

Naturally, most of the information in the literature relates to the easily identified low molecular weight species, and the data in this section reflects this. In addition, most thermal degradation studies focus on inert rather than oxidizing environments. Following the lead of the previous author, Norman Grassie, the vast majority of the entries included here are concerned with products of the first two types from purely thermal degradation processes under inert atmospheres.

B. TABLES

TABLE 1. MAIN-CHAIN ACYCLIC CARBON POLYMERS

Polymer	Temperature range (°C)	Degradation products	Refs.
1.1. UNSATURATED POLYMERS			
Poly(acetylene)	650	Methane (0.87 moles relative to benzene = 1), ethylene (0.47), ethane (0.26), propylene (0.27), propane (0.047), 1,3-butadiene (0.19), cyclopentadiene (0.086), cyclopentene (0.063), benzene (1.0), toluene (0.18), *m*-xylene (0.091), *p*-xylene (0.015), styrene (0.041), *o*-xylene (0.013), methylstyrene (0.010), *trans*-β-methylstyrene (0.011), indane (0.0074), indene (0.036), methylindene (0.0072), naphthalene (0.052), 2-methylnaphthalene (0.015), 1-methylnaphthalene (0.018), biphenyl (0.0091), fluorene (1.0), anthracene (0.005)	82
Poly(butadiene)	325–475	14.1% of products are volatile at 25°C including 1.5% of monomer among other saturated and unsaturated hydrocarbons; 85.9% of products are larger fragments involatile at 25°C	16
	20°C/min to 15% weight loss	Effect of *cis*/*trans* ratio; increasing *trans* content gives more cyclopentene and 1,3-cyclohexadiene and less 4-vinyl-1-cyclohexene and 1,3-butadiene	83

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(butadiene-*co*-acrylonitrile) (70/30)	310–400	14.5% of products are volatile at 25°C, consisting of saturated hydrocarbons	10
25–100 mol% butadiene	350–400	Main product is structurally modified chain fragments; ammonia and hydrogen cyanide increasing with acrylonitrile content to approximately 4% each by weight of copolymer containing mole 75% acrylonitrile; traces of hydrogen and hydrocarbons up to C_7	98
Poly(butadiene)-*blend*-poly(styrene) (0–100 wt.%)	Ambient to 500	Volatile products as for individual polymers	84
Poly(butadiene-*co*-sytrene) (75/25)	327–430	11.8% of products are volatile at 25°C; 1.9% butadiene with other saturated and unsaturated hydrocarbons	10,16
Poly(chloroprene)	377	Hydrogen chloride	19
	170–400	HCl (90% of theoretical), ethylene, chloroprene (trace), chloroprene dimers and other modified chain fragments	85
	400–500	HCl (trace), methane, ethylene, propylene (trace)	85
Poly(chloroprene)-*blend* poly(methyl methacrylate)	Ambient to 500	Methyl methacrylate, HCl, CO_2, CO, methyl chloride, methanol.	86
Poly(isoprene), synthetic	287–400	3.4% isoprene, 8.8% dipentene, small amounts of *p*-menthene.	2,16,31
97% *cis*-1,4; 3%, 3,4	384	In helium; methane (0.04 wt.%), ethylene (0.08), ethane (0.03), propylene (0.15), propane (0.06), isobutylene (0.09), butenes (0.07), methyl butene (0.09), isoprene (29), toluene (0.02), 2,3-dimethyl cyclopentene (1.2), octene (0.05), 2,4-dimethyl cyclohexene (0.16), *m*-xylene (0.33), 1-methyl-4-ethyl cyclohexene (0.18), 1,5-dimethyl-5-vinyl cyclohexene (2.5), dipentene (60), $C_{11}H_{18}$ (0.2), $C_{12}H_{18}$ (0.2), $C_{15}H_{24}$ (3.5), $C_{16}H_{26}$ (1.8)	87
natural rubber	287–400	3.9% isoprene, 13.2% dipentene, small amounts of *p*-menthene	2,16,31
	450–800	Dipentene main product at 450°C, optimum yields of isoprene in range 675–800°C, e.g., 58% at 750°C and 13 mbar	32
	500	Monomer, dimers (1,7,7-trimethyl-2,2,1-bicyclohept-2-ene, 2,5,6-trimethyl 1,3,6-heptatriene, dipentene/d,1-limonene), trimers	259
gutta percha	287–400	3.0% Isoprene, 15.6% dipentene, small amounts of *p*-menthene	2,16,31
Poly(isoprene)-*blend*-poly(styrene) (4/1 to 1/4, w/w)	Ambient to 500	Styrene, isoprene, dipentene larger chain fragments of both polymers, traces of ethylene, ethane, and propane	88
chlorinated rubber	Ambient to 500	HCl (almost quantitative), CH_4, C_2H_4, and H_2 are minor products formed in the later stages of reaction	89
chlorinated rubber-*blend*-poly(vinyl chloride)	160–350	HCl	90
Poly(perfluoro-4-chloro-1,6-heptadiene)	320–400	Completely volatilized – products unknown.	49
1.2. POLY(ALKENES)			
Poly(ethylene)	335–450	Continuous spectrum of saturated and unsaturated hydrocarbons from C_2–C_{90}; lower temperature favors larger fragments	13,16
–, low density	Ambient to 500	Continuous spectrum of saturated and unsaturated hydrocarbons C_1–C_{15}; trace of hydrogen	243
	264–289	In air; CO_2, H_2O, ethene, propene, propane, cyclopropane, butene, butane, pentene, pentane, hexene, hexane, heptene, heptane, octene, octane, methanol, ethanol, furan, tetrahydrofuran, formaldehyde, acetaldehyde, propanal, acrolein, butanal, isobutanal, pentanal, acetone, methyl vinyl ketone, methyl ethyl ketone, 2-pentanone, 2-hexanone, 2-heptanone, formic acid, acetic acid, propionic acid, acrylic acid, butyric acid, isovaleric acid, hydroxyvaleric acid, crotonic acid, caproic acid, butyrolactone, valerolactone	91
Poly(ethylene-*co*-carbon monoxide) Alternating copolymer	500	CO, H_2O, ethene, series of ketones with general structure $R–[–CO–CH_2–CH_2–]_n–CO–R'$ where R, $R' = –CH_3$, $–CH_2–CH_3$ or $–CH{=}CH_2$	270
Poly(ethylene-*co*-ethyl acrylate) 18 : 1 mole ratio	Ambient to 500	Broad spectrum of saturated and unsaturated hydrocarbons, ethyl esters and carboxylic acids; ethanol, ethylene, CO_2, CO and small amounts of ketene and ethyl acrylate	243
Poly(ethylene-*co*-vinyl acetate) (12–33 mol% vinyl acetate)	Ambient to 500	Acetic acid, ketene, CO_2, ethylene, saturated and usaturated hydrocarbons, chain fragment fraction containing some vinyl acetate units	92
(38.5% (wt.%) of ester groups)	260–290	Acetic acid > 99%	93
Poly(isobutene)	288–425	18.1% monomer together with methane, isobutane, and C_5 and higher saturated and unsaturated hydrocarbons	16
	Up to 1200	As temperature is increased the yields of fragments smaller than monomer increase at the expense of larger fragments	28

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
	325	At 4.9% weight loss, products are isobutene (64.3%), CH_4 (13.6%), neopentane (10.3%); remainder C_2–C_{12} hydrocarbons	29
	345	At 15.7% weight loss, products are isobutene (78.9%), CH_4 (5.9%), neopentane (4.7%); remainder C_2–C_{12} hydrocarbons	29
	365	At 46.8% weight loss, products are isobutene (81.6%), CH_4 (3.9%), neopentane (3.1%); remainder C_2–C_{12} hydrocarbons	29
	300–320	Two types of *t*-butyl ended and two types of isopropyl ended terminal monoolefins in range 2-mers to 12-mers	249
Poly(isopropenylcyclohexane)	400–900	Methylenecyclohexane and/or methyl-1-cyclohexene, ethylcyclohexane, toluene, isopropenylcyclohexane, isomer of isopropenylcyclohexane, ethyl benzene, isopropylcyclohexadiene, pentadienylcyclohexane (5 isomers), dicyclohexylpropane, 3-cyclohexenyl-1-cyclohexylpentadiene, dicyclohexylhexadiene	94
Poly(isopropenylcyclohexane-*co*-α-methylstyrene) (92/8 and 33/67)	400–900	Methylenecyclohexane and/or methyl-1-cyclohexane, benzene, toluene, isopropenylcyclohexane, ethylbenzene (92/8 only), decalin (92/8 only), cumene (33/67 only), α-methylstyrene, styrene, (33/67 only), pentadienylcyclohexane (92/8 only), indene and methyleneindene (33/67 only), naphthalene, dicyclohexylhexadiene (92/8 only). The following from the 33/67 copolymer only: 2-methylnaphthalene, 1-methylnaphthalene, biphenyl, methylstilbene, α-methylstilbene, anthracene/phenanthrene, dihydropyrene	94
Poly(4-methyl-1-pentene)	291–341	After 22 hours at 341°C, 20% residue, 71% saturated and chain fragments; 9% of products volatile at 25°C, comprising isobutene (56%), propane (34%), traces of monomer, and hydrocarbons	43
Poly(propylene)	328–410	Saturated and hydrocarbons from C_2 upwards, monomer yield 0.17%	13
	400–1200	As temperature is raised, yield of small fragments increases at expense of large fragments	28
	360–400	At 400°C, chain fragments with 7.05 wt.% of volatile products comprising principally, methane 0.057 wt.%, ethane 0.13, propane 0.078, propene 0.83, isobutene 0.16, butane 0.004, 2-methyl-1-butene 0.010, 1-pentene 0.008, pentane 1.62, 2-pentene (*cis* and *trans*) 0.015, 2-methyl pentane 0.074, 2-methyl-1-pentene 1.19, 2,4-dimethylpentane 0.032, 2,4-di-methyl-1-pentene 0.089, 4-methylheptane 0.24, 2,4-dimethyl-1-heptene 2.20, 4,6-dimethylnonane (threo form) 0.042 (erythro form) 0.052, 2,4,6-trimethyl-1-nonene (threo form) 0.055 (erythro form) 0.066	95
	120–280	In air; ethene, ethane, propene, propane, isobutene, butane, isobutane, pentadiene, 2-methyl-1-pentene, 2,4-dimethyl-1-pentene, 5-methyl-1-heptene, dimethylbenzene, methanol, ethanol, 2-methyl-2-propene-1-ol, 2-methyl furan, 2,5-dimethylfuran, formaldehyde, acetaldehyde, acrolein, propanal, methacrolein, 2-methyl propanal, butanal, 2-vinyl crotonaldehyde, 3-methyl pentanal, 3-methyl hexanal, octanal, nonanal, decanal, ethenone, acetone, 3-buten-2-one, 2-butanone, 1-hydroxy-2-propanone, 1-cyclopropylethanone, 3-methyl-2-buten-2-one, 3-penten-2-one, 2-pentanone, 2,3-butanedione	96
	200–356	Under 254 nm radiation; additional methane and ethylene are formed compared with the thermal reaction	97
Poly(propylene)-*blend*-poly(methyl methacrylate)	Ambient to 500	Poly(methyl methacrylate) stabilized by blending with polypropylene; pre-irradiation with 2537 Å radiation at ambient temperature reduces amount of methyl methacrylate formed on subsequent thermal degradation; missing methyl methacrylate units appear in a chain fragment fraction	99
Poly(vinylcyclohexane)	335–391	Small amounts of cyclohexane, cyclohexane, methylcyclohexene, methyl cyclohexane, vinylcyclohexene, vinylcyclohexane, ethylcyclohexane with larger chain fragments	2,3
	360–380	Cyclohexane (main product), cyclohexene, vinylcyclohexane, vinylcyclo hexane oligomers, methane, ethane, ethylene, propane, propylene, butane, butylene, hydrogen	100
Poly(chlorotrifluoro-ethylene)	Ambient to 500	Monomer, traces of dichlorodifluoroethene, chloropentafluoropropene, trichlorotrifluoroethane	261

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
1.3. POLY(ACRYLICS), POLY(METHACRYLICS)			
Poly(acrylic acid)	Ambient to 500	CO, CO_2, H_2O, CH_4, acetone, ketene, ethene, propylene, 1-butene, methyl vinyl ketone, benzene, acrylic acid, toluene, xylene, short chain fragments such as dimer to octamer with unsaturated and anhydride functionalities	297
–, methyl ester	292–399	26% of products are volatile at 25°C, mainly methyl alcohol and carbon dioxide with traces of monomer and methyl methacrylate and C_4–C_6 oxygenated compounds (74% of products are large chain fragments involatile at 25°C)	2,3
	Up to 980	Methanol (1.9%), methyl formate (trace), methyl acetate (1.4%), methyl acrylate (19.0%), methyl methacrylate (1.9%), saturated ester (2.1%), dimethyl glutarate (7.5%), methyl 4-methoxycarbonyl-pent-4-enoate (11.6%), trimethyl pentane 1,3,5-tricarboxylate (0.6%) methyl 4,6-di-methoxycarbonylhept-6-enoate (53%), saturated and tetramers (1.0%)	101
	50	Irradiated with high-pressure mercury lamp; methanol, formaldehyde, methyl acetate, methyl formate, CO_2, CO, H_2, CH_4	102
–, ethyl ester	300–500	Major products, carbon dioxide, ethylene, ethanol, and chain fragments; minor products, ethane, ethyl acrylate, and ethyl methacrylate	103
	50	Irradiated with high-pressure mercury lamp; CO, CO_2, ethanol, acetaldehyde, ethane, ethyl formate, acetal, ethyl propionate	104
	Ambient to 500	Ethylene, carbon dioxide, trace of ketene, ethanol (major product), various ethyl esters (see Ref.)	243
–, *n*-propyl ester	300–500	Major products carbon dioxide, propene, propanol, and chain fragments; minor products, propane, carbon monoxide, hydrogen, *n*-propyl acrylate, and *n*-propyl methacrylate	103
–, isopropyl ester	250–500	Major products carbon dioxide, propene; minor products isopropanol with trace carbon monoxide	105
–, *n*-butyl ester	300–500	Major products carbon dioxide, 1-butene, butanol, and chain fragments; minor products, butane, *n*-butyl acrylate, and *n*-butyl methacrylate	103
	50	Irradiated with high-pressure mercury lamp. CO, CO_2 *n*-butanol, butyraldehyde, *n*-butene, *n*-butyl formate, *n*-butyl valerate (after prolonged exposure)	104
–, *tert*-butyl ester	>160	86% isobutylene, 11% water, 3% carbon dioxide	4
–, 2-ethyl hexyl ester	300–500	Carbon dioxide, 2-ethyl-1-hexene, 2-ethyl-1-hexanol	103
–, benzyl ester	260–300	Major products are benzyl alcohol, chain fragments, partially crosslinked residue; minor products are CO_2, toluene, CO, CH_4, H_2	1
	–	CO_2, benzyl alcohol, and low polymers	106
–, 1,1,5-trihydroperfluoroamyl ester	300–315	Oligomers, 1,1,5-trihydroperfluoroamyl alcohol, monomer, 1,1,5-trihydroperfluoroamyl methacrylate	107
–, 2,2,2-trichloroethyl ester	319	2,2,2-Trichloroethanol (80%), monomer (9%), 1,1-dichloroethene, 2-chloroethanal, 2,2-dichloroethanal, 1,1-dichloropropane, 1,1,1-trichloroethane, 2,2,2-trichloroethylethanoate, 2,2,2-trichloroethyl chloromethanoate, 2,2,2-trichloroethylpropanoate, 2,2,2-trichloroethylmethacrylate, 2,2,2-trichloroethyl chloroethanoate, 2,2,2-trichloroethyl-2-chloroacrylate	263
–, α-bromo-, methyl ester	110–150	Methylbromide, hydrogen bromide	5
	600	CO_2, propene, methyl bromide, vinyl bromide	305
–, α-chloro-, methyl ester	600	CO_2, propene, methyl chloride, monomer	306
–, α-chloro-, *sec*-butyl ester	190	*sec*-Butyl chloride, butylene, hydrogen chloride	7
–, α-cyano-, methyl ester	>180	Yellows and some monomer formed	6
–, α-phenyl-, methyl ester	210–280	Monomer is the sole product	8
Poly(acrylic acid, magnesium salt)	Ambient to 500	CO, CH_4, CO_2, acetone, ketene, ethene, propene, 1-butene, benzene, toluene, xylene, cyclopentene, methyl ethyl ketone, diethyl ketone, methyl-*n*-propyl ketone, di-*n*-propyl ketone, methyl vinyl ketone, methyl isopropenyl ketone, methyl isopropyl ketone, ethyl vinyl ketone, trace amounts of methyl-*n*-butyl ketone, cyclopentanone, cyclohexanone, acrolein, ethanal and butanal, chain fragments, some monomer	312
Poly(acrylic acid, calcium salt)	Ambient to 500	CO, CH_4, CO_2, acetone, ketene, ethene, propene, 1-butene, benzene, toluene, mesitylene, xylene, methyl ethyl ketone, diethyl ketone, methyl-*n*-propyl ketone, methyl-*n*-butyl ketone, ethyl vinyl ketone, methyl propenyl ketone (trace), ethyl propyl ketone (trace), 3-methyl-cyclopentanone, cyclohexanone (trace), cyclohexa-2-enone,	312

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
		2-methyl-cyclohexanone, 1-methyl-cyclohexa-1-ene-3-one (trace), acrolein, mesityl oxide, ethanal, propanal, butanal, chain fragments, some monomer	
Poly(acrylic acid, sodium salt)	Ambient to 500	CO, CH_4, CO_2, ketene, 1-butene, propene, acetone, methyl ethyl ketone, methyl isopropyl ketone, methyl-*n*-propyl ketone, diethyl ketone, methyl propenyl ketone, 3-hexanone, toluene, 2-hexanone, 1,3-cyclopentadiene, cyclopentanone, 2-methyl cyclopentanone, mesityl oxide, xylenes, benzene, propionaldehyde, acrolein, acetaldehyde, ethene, short chain fragments, traces of monomer	303
Poly(acrylic acid, potassium salt)	Ambient to 500	CO, CH_4, CO_2, ketene, 1-butene, propene, acetone, methyl ethyl ketone, methyl *n*-propyl ketone, 1,4-cyclohexadiene, toluene, 1-methyl-1,3-cyclohexadiene, 2-hexanone, cyclopentene, 1-methyl cyclopentene, mesityl oxide, xylenes, benzene, ethene, cyclopentanone, 1,3-cyclopentadiene, diethyl ketone, short chain fragments, traces of monomer	303
Poly(methyl acrylate-*co*-methyl methacrylate) (mole ratios 112/1–2/1)	Ambient to 500	Monomers, CO_2, chain fragments larger than monomer, H_2; more stable than poly(methyl methacrylate); rapid decrease in molecular weight; products of phtodegradation at 170° by 254 nm radiation are qualitatively similar	108,109
Poly(methyl acrylate-*co*-acryloyl chloride) 6, 15, 41, 83 mol% AC	Ambient to 500	Acrylic acid, HCl, H_2O, CO, CO_2, acryloyl chloride, methyl acrylate, methyl acrylate chain fragments, anhydride and γ-lactone structures, chloro-methane, methyl methacrylate, methanol, 3,5-(6-chloro-2-pyrone) and fragments thereof, C_6, C_9, C_{12}, C_{15} fragments. Relative yields depend upon copolymer composition	262
Poly(methyl acrylate-*co*-2-bromoethyl methyacrylate) (10–82 mol% methyl acrylate)	Ambient to 500	CO_2, ketene, methyl bromide, acetaldehyde, methyl acrylate, methanol, 1,2-dibromoethane, methyl methacrylate, 2-bromoethanol, ethyl methacrylate, CH_4, CO, H_2 modified chain fragments	110
Poly(methyl acrylate)-*blend*-poly((2-bromoethyl methacrylate) (50/50, w/w)	Ambient to 500	CO_2, ketene (minor), methyl bromide, vinyl bromide (minor), acetaldehyde, methanol, methyl methacrylate, methyl acrylate, 1,2-dibromoethane, 2-bromoethyl methacrylate	111
Poly(*n*-butyl acrylate-*co*-methyl methacrylate) (3.9–93.4 mol% butyl acrylate)	313–332	1-Butene, carbon dioxide, butanol methyl methacrylate, butyl acrylate, and butyl methacrylate; small quantities of methane, ethane, propane, butane, ethylene, propene, *cis*, and *trans* 2-butene, hydrogen, and carbon monoxide increase with butyl acrylate content of the copolymer	112
	165	Under 2537 Å radiation; methyl methacrylate with smaller quantities of *n*-butyl acrylate, *n*-butanol, *n*-butyraldehyde, hydrogen, carbon monoxide, and methane; a chain fragment fraction increases with *n*-butyl acrylate content	113
Poly(*tert*-butyl acrylate-*co*-glycidyl methacrylate) (34/66)	0–700	CO, CO_2, propene, ethanal, isobutene, acrolein, allyl alcohol	114
Poly(methyl-α-chloroacrylate-*co*-2,2,2-trifluoroethyl methacrylate) (70/30)	Ambient	Gamma Radiolysis; CH_4, CO, ethylene, ethane, CH_3OH, CHF_3, HCl, C_3H_6, CO_2, C_2H_3F, CH_3Cl, methyl formate, CH_3CH_2Cl, CHF_3, CH_3CF_3, $CH_2{=}C(CH_3)COOCH_2CF_3$	115
Poly(methyl-α-chloroacrylate-*co*-2,2,2-trifluoroethyl methacrylate) (70/30)	Ambient	Gamma Radiolysis; CH_4, CO, ethylene, ethane, CH_3OH, HCl, C_3H_6, CO_2, CH_3Cl, methyl formate, CH_3CH_2Cl, CH_2Cl_2, $CHCl_3$	115
Poly(acrylonitrile)	<200	Colours through yellow, orange, red, and black	9
	250–280	12% of products are volatile at 25°C, consisting of hydrogen cyanide, acrylonitrile, and vinyl acetonitrile; 88% of products are involatile at room temperature	10,11
	280–450	Five major volatile products are cyanogen, HCN, acrylonitrile, acetonitrile, vinyl acetonitrile; involatile residue remains	12
	250–350	NH_3, HCN	116
	235	HCN, hydrogenated acrylonitrile, dimer and trimer, acetonitrile, methacrylonitrile	117
–, α-chloro	150–200	Hydrogen chloride	118
	Ambient to 500	Hydrogen chloride and small amount of HCN at higher temperatures	119
–, α-phenyl	Ambient to 500	High yields of monomer	119
Poly(acrylonitrile-*co*-2-bromoethyl methacrylate	Below 310	Ethylene, CO_2, vinyl bromide acetaldehyde, 1,2-dibromoethane	120
(50/50, mol/mol)	310–500	Propane, isobutene, CO_2, HCN, isocyanic acid, yellow-chain fragment fraction	121
Poly(acrylonitrile-*co*-methyl methacrylate)(1/410–1/8)	220–280	Only methyl methacrylate from 410/1 and 40/1 (molar ratio) copolymers; methyl methacrylate and small amounts of acrylonitrile from 16/1 and 8/1 copolymers; rapid decrease in the molecular weight of all copolymers	121

References page II - 475

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
	160	Photodegradation by 254 nm radiation gives methyl methacrylate from 410/1 to 8/1 copolymers with a 8/1 copolymer; rapid decrease in the molecular weight of all copolymers	121
Poly(acrylonitrile-*co*-methyl vinyl ketone)	–	Production of water from poly(methyl vinyl ketone) accelerated by copolymerization with acrylonitrile	122
Poly(acrylonitrile-*co*-styrene) (0/100–50/50, mol/mol)	292	Acrylonitrile causes increase in rate of chain scission; proportion of acrylonitrile among degradation products greater than from pure polyacrylonitrile; chain fragments increase with acrylonitrile content of copolymer; styrene, acrylonitrile, toluene, benzene, four dimers, and four trimers	123
(1.86–96.62 mol% acrylonitrile)	500	Hydrocyanic acid, acetonitrile, acrylonitrile, propionitrile, toluene, ethyl benzene, styrene, methane, ethylene, ethane, C_3 hydrocarbons, but-1-ene, prop-1-ene-3-nitrile, isopropylnitrile, benzene	124
Poly(acrylonitrile-*co*-vinyl acetate) (7.5 wt.% vinyl acetate)	260	HCN, hydrogenated acrylonitrile, dimer and trimer, acetonitrile, methacrylonitrile, acetic acid	117
Poly(acrylonitrile-*co*-methyl acrylate-*co*-vinyl bromide) (methyl acrylate, 10 wt.%; vinyl bromide, 5 wt.%)	180–320	CH_3Br, HBr, H_2O, CO_2, CH_3OH, NH_3, HCN, hydrogenated acrylonitrile, dimer and trimer, acetonitrile, methacrylonitrile, naphthyridine fragments	117
Poly(α-chloroacrylonitrile-*co*-methyl methacrylate)	> 150	Hydrogen chloride, methyl methacrylate, α-chloroacrylonitrile	125
(0–50 mol% α-chloroacrylonitrile)	Ambient	Under 254 nm radiation. HCl, CO_2, methyl chloride, methyl formate, methanol, methyl methacrylate, CO, CH_4, H_2	126
Poly(acrylonitrile)-*blend*-poly(methyl methacrylate) (50/50, w/w)	Up to 320	NH_3, HCN, MMA	127
	320–500	Chain-fragment fraction and small amounts of CO, CO_2, methanol, CH_4	
Poly(acryloyl chloride)	Ambient to 500	Acrylic acid, HCl, H_2O, CO, acryloyl chloride, 3,5-(6-chloro-2-pyrone) and fragments thereof, C_6, C_9, C_{12}, C_{15} fragments	262
Poly(methacrylic acid)	200	Almost quantitative yields of H_2O, traces of monomer, residue of poly(methacrylic anhydride)	33
	900	CO_2, propene, butenes, pentenes, pentadienes, hexene, hexadienes, hexatrienes, benzene, toluene, heptene, heptatriene, methacrylic acid, xylene, octatriene, octadienyne, nonatriene, hexadienoic acid, decatriene, decatetraene, decapentaene, undecatriene, methylbenzoic acids, trimethylbenzoic acid	128
–, methyl ester	170–300	100% monomer	34, 35
	246–400	As temperature is raised fragmentation increases to give complex series of products and monomer yields correspondingly decreases	2
	160	100% monomer under 253.7 nm radiation	36
	100–400	Under 254 nm radiation; 100% monomer	129
–, ethyl ester	250	Monomer	37
	245	Monomer, ethanol, ethanoic acid	300
–, *n*-propyl ester	250	Monomer	37
–, *iso*-propyl ester	250	Monomer	37
–, *n*-butyl ester	250	40% monomer and traces of 1-butene	38
	170	100% monomer under 253.7 nm radiation	38
–, *iso*-butyl ester	250	Monomer	37
–, *sec*-butyl ester	250	Monomer and small amount of olefin by cracking of side chain	37
–, *tert*-butyl ester	180–200	High yields of isobutylene and water, 1% monomer, trace of methacrylic acid, residue of poly(methacrylic anhydride)	39
	< 180	100% monomer under 253.7 nm radiation	
–, *n*-amyl ester	250	Monomer	37
–, *iso*-amyl ester	250	Monomer	37
–, 1,2-dimethylpropyl ester	250	Monomer and small amount of olefin by side chain cracking	37
–, neopentyl ester	250	Monomer	37
–, 3,3-dimethylbutyl ester	250	Monomer	37
–, 1,3-dimethylbutyl ester	250	Monomer and small amount of olefin by side chain cracking	37
–, 2-bromoethyl ester	Ambient to 500	2-Bromoethyl methacrylate (> 95%), CO_2 (< 1%), vinyl bromide (< 1%)	130
–, 2-sulfoethyl ester	50–600	CO, CO_2, H_2O, SO_2, ethene	290
	600	CO, CO_2, propene, acetaldehyde, methyl bromide, butene, vinyl bromide, ethyl bromide, methyl methacrylate	305
–, 2-chloroethyl ester	600	CO_2, propene, acetaldehyde, vinyl chloride, ethyl chloride, monomer	306
	268	Monomer (99%), traces of acetaldehyde, methyl methacrylate, 1,2-dichloroethane, ethylene methacrylate	268

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(methacrylic acid), 2-fluoroethyl ester	600	CO_2, vinyl fluoride, acetaldehyde, fluoroacetaldehyde	310
–, 2,2-dichloroethyl ester	242	Monomer (90.7%), chloroacetaldehyde (8%), 1,1,2-trichloroethane (0.5%), 2,2-dichloroethanol, methacrylic acid (0.1%), 2-chloroethylene methacrylate (0.1%)	268
–, 2-methoxyethyl ester	Ambient to 300	Monomer, CO_2	309
	Ambient to 500	Monomer, CO_2, CO, CH_4, ethene, formaldehyde, isobutene, methyl vinyl ether, methanol	309
–, 2,3-dibromopropyl ester	600	CO_2, propene, acetaldehyde, methyl bromide, butene, ethyl bromide, bromocyclopropane or 2-bromopropane	305
–, 2-hydroxyethyl ester	375–500	2-Hydroxyethyl methacrylate (20% at 500°C), ethylene dimethacrylate (6%at 500°C)(main products), ethylene glycol, 3-methyl-5-hydroxy-δ-valerolactone (probably), 1,2-di-iospropenyl-oxyethane (probably), CO, CO_2, methane, ethylene, ethane, propane, H_2O	131
–, 2,2,2-trifluoroethyl ester	Ambient	Gamma radiolysis; CH_4, CO, ethylene, ethane, CH_3OH, CH_3F, C_3H_6, CO_2, C_2H_3F, methyl formate, CH_3CHFOH, CHF_3, CF_3CH_3, CF_3OH, $CH_2{=}C(CH_3){-}COOCH_2CF_3$	115
	600	CO_2, vinylidene fluoride, trifluoroacetaldehyde, trifluorethanol, monomer	310
–, 2,2,2-trichloroethyl ester	600	CO_2, propene, vinyl chloride, vinylidene chloride	306
	240	1,1-Dichloroethene, chloroform, methyl methacrylate, methacrylic acid, 2,2,2-trichloroethanol, 2,2,2-trichloroethyl acrylate, 2,2,2-trichloroethyl methacrylate, 2,2-dichloroethyl methacrylate, $CH_2{=}C(CH_3){-}COOCH{=}CCl_2$ or $CH_2{=}C(CH_3){-}COOCCl{=}CHCl$	300
–, hexafluoroisopropyl ester	600	CO_2, trifluoracetaldehyde, acetaldehyde, 1,1,1,3,3,3-hexafluoropropane, hexafluoro-isopropylformate	310
–, bisphenol S ester	464	CO_2, SO_2, phenol, bisphenol S, hydroquinone, fragments of backbone, benzene sulfonic acid	248
–, allyl ester	Ambient to 500	CO_2, CH_4, CO, H_2, propene, isobutene, dimethyl ketene, acrolein, diallyl ether, allyl methacrylate monomer and dimer, chain fragments including anhydride structures from side-group cyclization and an aliphatic ketone in the vicinity of unsaturation	283
–, phenyl ester	Ambient to 500	Monomer, some CO_2	314
–, glycidyl ester	Ambient to 500	CO, CO_2, dimethyl ketene, isobutene, propene, acrolein, allyl alcohol, glycidyl methacrylate, glycidol, short chain fragments with some unsaturation	302
–, ammonium salt	Ambient to 500	Isocyanic acid, NH_3, HCN, isobutene, CO_2 (trace), methacrylonitrile (trace)	132
–, Li, Na, K, and Co salts	Ambient to 500	Ethylene, butene-1, isobutene, acetylene, CO_2, CH_4, CO, acetone, isopropylaldehyde, methacrolein, butyraldehyde, methyl ethyl ketone, benzene (trace), methyl isopropyl ketones, methyl isopropenyl ketone, diethyl ketone, methyl *n*-propenyl ketone, cyclopentanone, methyl cyclopentanone, dimethyl cyclopentanone, dimethyl cyclopentenone and traces of toluene, di-isopropyl ketone, mesitylene, mesityl oxide	133
–, Mg, Ca, Sr, and Ba salts	Ambient to 500	CO_2, dimethyl ketene trace amounts of CO, CH_4, isobutene, butene-1, ethylene, acetylene, benzene toluene isobutyraldehyde, methyl ethyl ketone, methyl isopropenyl ketone, diethyl ketone, methyl isopropenyl ketone, di-isopropyl ketone, cyclopentanone, 2-methyl cyclopentanone, 2,5-dimethyl-cyclopentanone, 2,5-dimethylcyclopent-3-ene-1-one, methacrolein, butyraldehyde	134
Poly[α-ω-(diethylene glycol phthalate)dimethacrylate]	300	Monomer	194
	400	Monomer, phthalic anhydride, diethylene glycol, C_2H_4, propylene, CO_2	194
Poly(methyl methacrylate-*co*-alkali (metal methacrylates) (Li, Na, K) (0–100 mol%)	Ambient to 500	CO_2, alkenes, CH_4, CO, propanal methanol (major), acetone, 2-methyl propanal, methacrolein, butanal, methyl ethyl ketone, methyl isopropyl ketone, methyl isopropenyl ketone, methyl methacrylate (major), methyl prop-2-enyl ketone, toluene, di-isopropyl ketone, cyclopentanone, 2-methyl cyclopentanone, 2,5-dimethyl cyclopentanone, 2,5-di-methyl cyclopent-3-enone. Relative yields depend upon salt and copolymer composition	135
Poly(methyl methacrylate-*co*-2-bromoethyl methacrylate) (50/50, mol/mol)	Ambient to 500	Methyl methacrylate, 2-bromoethyl methacrylate, traces of vinyl bromide and CO_2	130
Poly(methyl methacrylate-*co*-methacrylamide)	Up to 340	> 35 mol% methacrylamide. MMA, methanol, NH_3, H_2O	146

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
	>340	Methacrylamide; chain fragments and small amounts of CH_4, CO_2, CO, HCN, methacrylonitrile and isobutene	146
	–	<10 mol% methacrylamide. Degradation becomes progressively more like that of PMMA	146
Poly(methyl methacrylate-*co*-methacrylic acid)	<300	Water and methanol	136
	>300	Methyl methacrylate, CO_2, CO, CH_4	
	900	(50/50 and 75/25); CO_2, propene, butenes, pentenes, pentadienes, hexene, hexadienes, hexatrienes, benzene, methyl isobutyrate, methyl methacrylate, toluene, heptene, heptatriene, methyl pentenoate, methacrylic acid, xylene, octatriene, octadienyne, nonatriene, hexadienoic acid, decatriene, decatetraene, decapentaene, undecatriene, methylbenzoic acids	128
Poly(methyl methacrylate-*co*-2-chloroethylmethacrylate) 22 mol% CEMA	600	CO_2, propene, acetaldehyde, vinyl chloride, ethyl chloride, methyl methacrylate	306
Poly(methyl methacrylate-*co*-2,2,2-trichloroethyl methacrylate) 24 mol% TCEMA	600	CO_2, propene, vinyl chloride, vinylidene chloride, dichloroacetaldehyde, methyl methacrylate	306
Poly(methyl methacrylate-*co*-methyl-α-chloroacrylate) 38 mol% MCA	600	CO_2, propene, methyl chloride, methyl methacrylate	306
Poly(methyl methacrylate-*co*-2-bromoethyl methacrylate) 22 mol% BEMA	600	CO_2, propene, acetaldehyde, methyl bromide, butene, vinyl bromide, methyl methacrylate	305
Poly(methyl methacrylate-*co*-2,3-dibromopropyl methacrylate) 16 mol% DBPMA	600	CO, CO_2, ethene, propene, methyl bromide, butene, vinyl bromide, ethyl bromide, 1-bromopropene, 2-bromopropene, cyclopropyl bromide, methyl methacrylate	305
Poly(methyl methacrylate-*co*-methyl-α-bromoacrylate) 22 mol% MBA	600	CO_2, acetaldehyde, methyl bromide, butene, vinyl bromide, unidentified alkenyl bromides, methyl methacrylate	305
Poly(methyl methacrylate-*co*-chlorotrifluoroethylene) 7.7 mol% MMA	Ambient to 500	HCl, CO_2, CH_3Cl, C_2F_3Cl (monomer), C_3F_5Cl, $C_2F_3Cl_3$, methyl methacrylate, chain fragments possibly with some lactonization	281
77.7 and 85.7 mol% MMA	Ambient to 500	HCl, CO_2, CH_3Cl, C_2F_3Cl (monomer), methyl methacrylate	281
Poly(methyl methacrylate-*co*-2-sulfoethyl methacrylate) 20, 40, 60 mol% MMA	50–600	CO, CO_2, H_2O, SO_2, ethene, methanol, methyl methacrylate (only 60 and 80 mol% methyl methacrylate copolymers)	290
Poly(methyl methacrylate-*co*-4-vinylpyridine) 22, 35, 46, 56 mol% 4-vinyl pyridine	Ambient to 500	4-vinyl pyridine, methyl methacrylate, traces of pyridine and 4-methyl pyridine	260
Poly(methyl methacrylate-*co*-phenyl methacrylate) 9, 18, 47, 88 mol% PMA	Ambient to 500	CO_2, isobutene, ketene, formaldehyde, methanol, methyl methacrylate, phenyl methacrylate, chain fragments including six-membered anhydride ring structures. Product distribution varies with copolymer composition with non-monomer products most pronounced at low PMA contents	314
Poly(methyl methacrylate-*co*-glycidyl methacrylate)	Ambient to 500	CH_4, CO, CO_2, propene, isobutene, dimethyl ketene, acrolein, allyl alcohol, glycidol, glycidyl methyl ether, methyl methacrylate, glycidyl methacrylate, chain fragments. Distribution varies with copolymer composition	286
Poly(methyl methacrylate -*block*-*t*-butylaziridine) ABA type copolymer with MW 12000 butylaziridine (B) and MW 16000 MMA (A)	Ambient to 600	CO, CH_4, CO_2, ethene, propene, isobutene, aziridine, methanol, methyl methacrylate, α-methylstyrene, 2-phenyl-2-butene, 1-*t*-butylamino-2-isopropenylamino-ethane, 2-*t*-butylaminoethyl-ethyl-isopropenylamine, 2-aminoethyl-2-*t*-butylaminoethyl-isopropenylamine, oligomers – principally butylaziridine based	287
Poly(methyl methacrylate-*co*-styrene)	260–340	Methyl methacrylate, styrene and oligomers of styrene; formation of oligomers of styrene strongly inhibited by presence of methyl methacrylate units	137
Poly (methyl methacrylate-*co*-vinyl acetate) (5–40 mol% vinyl acetate)	Ambient to 500	Acetic acid, methyl methacrylate, methyl acetate, chain fragment fraction, ketene, CO_2	92

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(methyl methacrylate-*co*-vinyl bromide) (6–75 mol% vinyl bromide)	Ambient to 500	Methyl methacrylate, methyl bromide, methanol, CO_2, methanol, HBr, CO, H_2 and other unidentified minor products. Relative amounts depend upon copolymer composition	138
Poly(2-bromoethyl methacrylate-*co*-styrene) (50/50, mol/mol)	Ambient to 500	Styrene, 2-bromoethyl methacrylate, modified chain fragement fraction. Minor products; ethylene, CO_2, HBr, vinyl bromide, acetaldehyde	139
Poly(methyl methacrylate)-*blend*-ammonium polyphosphate	Ambient to 450	H_2O and NH_3 from ammonium polyphosphate. Methyl methacrylate (major product), CO, CO_2, methanol, dimethyl ether, hydrocarbons, high boiling chain fragments	140
Poly(methyl methacrylate)-*blend*-poly(styrene)	Ambient to 500	Polymers degrade separately without interaction to give same products as polymers degraded separately; copolymers and mixtures of the same molar compositions can be distinguished by degradation behavior	141
Poly(methyl methacrylate)-*blend*-poly(vinyl acetate) (10/1–1/1, w/w)	Ambient to 500	Methyl methacrylate, acetic acid, methyl acetate, methanol, CO_2, butene, benzene, ketene	142
Poly(methyl methacrylate)-*blend*-poly(vinyl bromide) (50/50, mol/mol)	Ambient to 500	Methyl methacrylate, HBr, CO, CO_2 and other unidentified products	143
Poly(methyl methacrylate)-*blend*-poly(vinyl chloride)	Ambient to 500	Major products: HCl, methyl methacrylate; minor products: CO_2, methyl chloride, benzene	144,145
Poly(methacrylamide)	Up to 340	NH_3 and H_2O	146
	Above 340	Chain fragments (50%) in which a high proportion of amide groups have been converted to cyclic imides; small amounts of CO_2, CH_4, HCN	146
	Ambient to 500	NH_3, HCN, isobutene, CO_2(trace), methacrylonitrile (trace)	132
Poly(methacrylonitrile)	<200	Non-volatile material, coloration through yellow, orange, and red	40
	220–270	50–100% monomer depending upon pretreatment and purity of polymer	40
	Ambient to 500	Ethene, propene, isobutene, HCN, CO_2(from benzoyl peroxide end groups), methacrylonitrile (major product), 2-cyanobutane, 2-cyanopentene, CH_4	277
Poly(methacrylonitrile-*co*-styrene) 10 : 1 mole ratio	Ambient to 500	Ethene, isobutene, HCN, methacrylonitrile, styrene, toluene, α-methylstyrene, β-methylstyrene, 2-phenylbutene, 4-cyano-2,4-dimethylpentene, 4-phenyl-2-methylbutene, 3-phenyl-2-propenenitrile, chain fragments	279
Poly(methacrylonitrile-*co*-styrene) 1 : 1 mole ratio	Ambient to 500	Ethene, isobutene, HCN, methacrylonitrile, styrene, toluene, α-methylstyrene, 4-phenylbutene, 4-phenyl-2-methylbutene, 3-phenyl-2-propenenitrile, chain fragments	279
Poly(methacrylonitrile-*co*-styrene) 1 : 10 mole ratio	Ambient to 500	Ethene, isobutene, HCN, methacrylonitrile, styrene, toluene, α-methylstyrene, β-methylstyrene, 4-phenylbutene, allylbenzene, 4-phenyl-2-methylbutene, 3-phenyl-2-propenenitrile, chain fragments	279
1.4. POLY(VINYLS)			
Poly(tert-butyl-*N*-vinyl carbamate)	185–220	Equal amounts of CO_2 and isobutylene, in yields ranging from 43 to 60%	196
Poly(chlorotrifluoroethylene) (KEL-F)	347–418	25% of products volatile at 25°C–monomer with traces of C_3F_5Cl and $C_3F_4Cl_2$; 72.1% of larger chain fragments involatile at 25°C	14
Poly(1,1-dichloro-2,2-difluoroethylene)	240	20% black involatile residue; 80% monomer	22
Poly(perfluoroheptene)	210–270	100% monomer	49
Poly(perfluoropropylene)	280–400	100% monomer	49
Poly(tetrafluoroethylene)	504–538	>95% monomer, 2–3% C_3F_6, no larger fragments (in vacuum)	14
	1200	Monomer yield drops, larger fragments appear (in vacuum)	23
	600–700	At 6.66 mbar pressure; pure monomer; at 1013 mbar pressure, 15.9% monomer, 25.7% C_3F_6, 58.4% C_4F_8	24
Poly(trifluoroethylene)	380–800	High yields of HF and products involatile at 25°C	23
Poly(vinyl acetate)	213–235	Quantitative yields of acetic acid	71
	300	Small amounts of aromatics including benzene	71
	280–350	Acetic acid, benzene, naphthalene, toluene, styrene, ethyl benzene, propenyl benzene, propylbenzene, methylnaphthalene, ethylnaphthalene, propenylnaphthalene, propylnaphthalene, anthracene, methylanthracene, ethylanthracene, propylanthracene	147
Poly(vinyl acetate) in presence of zinc bromide	Ambient to 500	Acetic acid produced as low as 100°C	148
Poly(vinyl acetate-*co*-maleic anhydride) alternating copolymer	Ambient to 500	Acetic acid, CO_2, H_2O, maleic anhydride, CO	240
Poly(vinyl acetate-*co*-crotonic acid) alternating copolymer	Ambient to 500	Ethene, propene, acetic acid, CO_2, propanoic acid, 2-methylpropanoic acid, butanoic acid, cyclopentanone, some unsaturated cyclic and acyclic aliphatic ketones, some chain fragments containing lactones	241

References page II - 475

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(vinyl acetate-*co*-methylvinylidene cyanide) Alternating with 10-15 mol% VA homosequence	285–350	Vinyl acetate, acetonitrile, HCN, acetic acid, acetamide, 2-methyl-1-aminonaphthalene, 3-cyano-3-pentene	266
Poly(vinyl acetate-*co*-styrene) (5–20 mol% vinyl acetate)	Ambient to 500	Acetic acid, styrene, chain fragment fraction, ketene, CO_2	92
Poly(vinyl acetate-*co*-vinyl alcohol) (50–99 mol% vinyl alcohol)	0–600	Acetaldehyde, acetone, benzene, crotonaldehyde, acetic acid	154
Poly(vinyl acetate-*co*-vinyl chloride)	Ambient to 500	Bulk polymer; hydrogen chloride and acetic acid in the proportions of the monomers in the copolymer; at each end of the composition range, incorporation of the comonomer results in a copolymer less stable than the homopolymer; minimum stability at 40–50 mol% vinyl acetate	155
	180	In tritolyl phosphate solution; similar to bulk polymer with minimum in stability at 30–40 mol% vinyl acetate	156
Poly(vinyl acetate-*co*-vinyl fluoride) (91 : 9 to 1 : 89)	200–500	Hydrogen fluoride, acetic acid, hydrocarbons	150
(80 : 20 to 23 : 77)	200–500	Hydrogen fluoride, HCl, hydrocarbons	150
Poly(vinyl acetate)-*blend*-poly(styrene) (1/1, w/w)	Ambient to 500	Products as for individual polymers	158
Poly(vinyl acetate-*blend*-poly(vinyl chloride)	Ambient to 500	Acetic acid, HCl, and traces of CO_2, ketene, acetyl chloride, CO and CH_4	157
Poly(vinyl alcohol)	250	Quantitative yields of H_2O	72
	240	Main products H_2O and C_2H_5OH, with aldehydes CH_3—$(CH{=}CH)_n$—CHO and ketones CH_3—$(CH{=}CH)_n$—$COCH_3$ where $n = 0,1,2$, etc.	73
Poly(vinyl bromide)		HBr, ethylene, benzene, and other unidentified minor products	143
Poly(vinyl butyrate)	300–325	Butyric acid	74
Poly(*N*-vinylcarbazole)	230–410	Below 350°, monomer; above 350°, monomer and low-molecular weight oligomers	175
	300–500	Monomer (49% of total volatiles at 300°C, 39% at 500°C) ethane, ethene, propene, *n*-butane, isobutene, *cis* and *trans* but-2-ene, 1,3-butadiene, 2-methylbutadiene, trace amounts of C_5 and C_6 hydrocarbons	244
Poly(3,6-dichloro *N*-vinylcarbazole)	300–500	Monomer (83% of total volatiles at 300°C, 67% at 500°C), ethane, ethene, propene, *n*-butane, isobutene, *cis* and *trans* but-2-ene, 1,3- butadiene, 2-methylbutadiene, trace amounts of C_5 and C_6 hydrocarbons	244
Poly(3,6-dibromo *N*-vinylcarbazole)	350–500	Monomer (48% of total volatiles at 350°C, 40% at 500°C), ethane, ethene, propene, *n*-butane, isobutene, *cis* and *trans* but-2-ene, 1,3-butadiene, 2-methylbutadiene, trace amounts of C_5 and C_6 hydrocarbons	244
Poly(vinyl chloride)	200–300	Quantitative yields of HCl	75
	400	Saturated and unsaturated, aliphatic and aromatic hydrocarbons are produced with benzene and toluene in high yield	75
	600	In helium; quantitative yield of HCl, remainder residue and hydrocarbons; benzene is major volatile hydrocarbons product	76
	200–800	Aliphatic hydrocarbons, benzene (major product), toluene, ethylbenzene, *o*-xylene, monochlorobenzene, styrene, vinyl toluene, *p*-dichlorobenzene, *o*-dichlorobenzene, indene, 1,3,5-trichlorobenzene, 1,2,4-trichlorobenzene, naphthalene, α-methylnaphthalene, β-methylnaphthalene; effect of ZnO, SnO_2, and Al_2O_3 on the yields of products is also recorded	149
	Ambient to 1000	HCl, CO_2, ethene, ethane, propane, 1-butene, 2-butene, 1-pentene, cyclopentene, *n*-pentane, 2-methylbutane, 1,3-pentadiene, 2-methyl-1,3-pentadiene, complex series (60 identified) of aromatic and polyaromatic species, including benzene, styrene, methylstyrenes, toluene, *o*-xylene, *m*-xylene, *p*-xylene, biphenyl, naphthalene, anthracene, phenanthrene, pyrene, etc. (see Ref.)	267
Poly(vinyl chloride)-*blend*-poly(α-methylstyrene)	Ambient to 500	HCl, α-methyl styrene	159
Poly(vinyl chloride)-*blend*-poly(styrene)	Ambient to 500	HCl, styrene	159
(10/1 to 1/10, w/w)	Ambient to 500	Products as for individual polymers	160
PVC 1 : 1 blend with bisphenol A polycarbonate	Ambient to 500	CO_2, HCl, benzene, traces of toluene, phenol and other phenolic compounds, bisphenol A, polycarbonate chain fragments	291

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
PVC 1 : 1 blend with poly(dimethylsiloxane)	Ambient to 500	HCl, benzene, traces of toluene, octamethylcyclotetrasiloxane, oligomeric siloxanes	292
Poly(vinyl fluoride)	372–480	High yields of HF and products involatile at 25°C – little carbonization	23
	200–500	Hydrogen fluoride, C_2–C9 fractions	150
	450	85% wt. loss, 33 ± 5% volatile products, remainder was oily green liquid; Volatile products: HF (82 mol%), CH_4 (5.2), C_2H_6 (0.6), ethylene (0.8), acetylene (0.03), fluoroethylene (0.07), propene (0.5), C_3H_5F (0.4), butane (0.06), butene (1.1), 1,4-butadiene (0.2), 1,3-butadiene (0.7), C_4H_5F (0.06), Cyclopentadiene (0.05), benzene (4.5), fluorobenzene (0.3), toluene (1.0), $C_6H_4(CH_3)F$ (0.04), $C_6H_5C_2H_5$ or $C_6H_4(CH_3)_2$, and styrene (0.9), *n*-propylbenzene (0.2), iso-propylbenzene (0.3), C_6H_5–C_3H_5 (0.2), indene (0.3), naphthalene (0.8), fluoronaphthalene (0.3)	151
Poly(vinylidene chloride)	225–275	High yields of HCl	77
	170	Polymer prepared in presence of oxygen; phosgene, formaldehyde, HCl	152
Poly(vinylidene cyanide)	>160	High yields of monomer	78
Poly(vinylidene fluoride)	400–530	35% HF and high yields of products involatile at 25°C – some carbonization	23
	Ambient to 500	Monomer, dimer ($C_4F_3H_3$), SiF_4, (from reaction of HF with glass)	265
Poly(vinylidene fluoride-*co*-chlorotrifluoroethylene) 80 mol% vinylidene fluoride	Ambient to 500	HCl, HF, vinylidene fluoride, chlorotrifluoroethylene, dimer ($C_4F_3H_3$)	265
3, 10 mol% vinylidene fluoride	Ambient to 500	HCl, chlorotrifluoroethylene, dichlorodifluoroethene, chloropentafluoropropene, trichlorotrifluoroethane, dimer ($C_4F_3H_3$)	265
Poly(vinyltrimethylsilane)	300–600 in argon	Tetramethylsilane, trimethylvinylsilane, 2-trimethylsilylpropene, 1,3-tri-methylsilylpropane, 1,3-trimethylsilylpropene, 2,4-trimethylsilylbutene-1,2,4,6-trimethylsilylhexene-1	153
Poly(4-vinyl pyridine)	Ambient to 500	Monomer, traces of pyridine and 4-methyl pyridine	260
Poly(vinylacetophenone)	380	CO, CH_4, ethane, 4-acetyl styrene, 4-acetyl toluene, styrene, toluene, 4-vinyl acetaldehyde, α-methylstyrene, α-methyl-4-acetylstyrene, 4-methylstyrene	307
Poly(*N*-acryloyl-*N′*-cyanoacetohydrazide)	600	Cyanoactetamide	289

1.5. POLY(VINYL KETONES), POLY(VINYL ETHERS)

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(methyl isopropenyl ketone)	270–360	H_2O	41
	Ambient to 500	Methyl isopropenyl ketone (50%), modified chain fragments, water, small amounts of CH_4 and CO	161
	150–190	Monomer under 313 nm radiation	42
Poly(methyl vinyl ketone)	270–360	H_2O, 3-methyl-2-cyclohexene-1-one and other six-membered ring ketones	44
	Ambient to 500	Water, modified chain fragments, small amounts of CH_4 and CO	161
Poly(trifluorovinyl phenyl ether)	275–500	Maximum of 75% volatilization–products unknown	49

1.6. POLY(STYRENES)

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(styrene)	300–400	40.6% monomer, 2.0% toluene, 0.1% CO, remainder dimer, trimer, and tetramer – monomer yield increases with pressure of nitrogen – 62% at 1013 mbar	62,63
	500–1200	Small hydrocarbon fragments appear (C_1–C_6) – fragmentation is greater the higher the temperature and the greater the pressure of inert gas	28
	300–570	Pulsed pyrolysis and 40 μg of polymer. Styrene (92.4–99.8% depending upon temperature), benzene, toluene, and ethyl benzene	163
	Ambient to 500	Thin films (1000 Å or less), monomer yield about 55%	164
–, (crosslinked)	346–450	Crosslinking with increasing quantities of divinyl or trivinyl benzene progressively decreases the styrene yield–the yield of larger chain fragments and the amount of carbonization also increase	11,64
–, (head-to-head)	320	Monomer, dimer, trimer, tetramer, pentamer, stilbene	165
	500 under N_2	Hydrocarbons (C_1–C_4) (2.2 relative GC peak intensity), benzene (0.4), toluene (3.3), ethylbenzene (2.0), styrene (20.4), 3-phenyl-1-propene (1.5), 1-phenylpropane (2.3), α-methylstyrene (0.3), 1-phenylbutadiene (1.0), diphenylmethane (0.3), 1,1-diphenylethylene (2.6), 1,2-diphenylethane (1.3), 1,2-diphenylpropane, (0.7), 1,2-diphenyl-1-propene (0.5), 2,3-diphenyl-1-propene (2.2), 3,4-diphenyl-1-butene (0.5), 2,3-diphenylbutadiene (2.0), 1,2-diphenylethylene (6.5), 1,4-diphenylbutane (3.5), 1,4-diphenyl-1-butene (3.8), 1,4-diphenyl-1-pentene (1.3),	166

References page II - 475

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
		1,3-diphenylpropadiene (2.1), 1,2-diphenylbutadiene (1.8), 1,4-diphenylbutadiene (1.9), 1,3,4-triphenylbutene (0.6), 1,2,5-triphenylpentane (1.5), 1,2,5-triphenyl-1-pentene (4.6), 2,3,6-triphenyl-1-hexene and 2,5,6-triphenyl-1-hexene (8.9), 1,4,5-triphenyl-1-pentene (4.4)	
	Ambient to 600	Styrene, 1,2-diphenylethene, 1,2-diphenylpropane, 1,4-diphenylbutane, 1,4-diphenyl-1-butene, 1,4-diphenylpentane, 4,5-diphenyl-1,8-octadiene, 2,3,6-triphenyl-1-hexene, 1,4,5-triphenyl-1-pentene	271
–, (poly(divinyl benzene))	385–450	Volatile products include toluene, benzene, styrene, and xylene	11,64
–, (poly(trivinyl benzene))	470–500	Mixture of aliphatic and aromatic hydrocarbons	11,64
–, α-acetoxy-	270	Acetic acid (99%), mixture of α-acetoxystyrene and acetophenone (1%)	167
–, *m*-amino-	340–500	Gaseous fraction CO_2, CH_4, C_2H_6, C_3H_6, C_3H_8; liquid fraction *m*-aminostyrene, *m*-toluidine; gum fraction mainly dimer and trimer; crosslinked residue remains	65
	320–500	Monomer yield rises from 41% (320°C) to 61%(500°C); minor product is *m*-toluidine, with traces of aniline, *m*-ethylaniline, α-methyl-*m*-aminostyrene, H_2, CO_2, CH_4; remainder comprises chain fragments and residue	66
–, *p*-chloro-α-methyl-	Ambient	Gamma radiolysis: CH_4 (12.9 relative mass spec. ion current), C_2H_6 (21.8), C_3H_6 (13.6), C_3H_8 (10.5), C_4H_{10} (61), HCl (4.2), CH_3Cl (17.4), C_3H_4Cl (20), C_2H_5Cl (28.1), C_3H_7Cl (3.3), CH_2Cl_2 (9.9), C_6H_5Cl (3.0), *p*-chlorostyrene (1.5), *p*-chloro-α-methyl styrene (12.5)	168
–, α-deutero-	334–387	68.4% monomer, 1.5% α-deuterostyrene, 0.6% α-methylstyrene, 29.5% larger chain fragments	2,13
–, β-deutero-	345–384	39.7% monomer, 1,2% toluene, 0.1% deuterotoluene, 59% larger chain fragments	2,13
–, *p*-fluoro-α-methyl-	Ambient	Gamma radiolysis: CH_4 (0.4 relative mass spec. ion current), C_3H_4 (3.0), C_3H_6 (0.6), C_3H_8 (0.8), C_4H_4 (3.5), C_4H_6 (6.0), C_3H_7F (3.2), C_4H_3F (6.0), C_4H_9F (14.5), C_5H_5F (9.37), C_6H_5F (29), *p*-fluorotoluene (23), *p*-fluorostyrene (6.45), *p*-fluoro-α-methyl styrene (175.5), *p*-fluoro-isopropyl benzene (11.5)	168
–, *p*-methoxy-α-methyl-	Ambient	Gamma radiolysis: CH_4 (32 relative mass spec. ion current), H_2O (26), C_2H_4 (35), C_3H_4 (7.3), C_3H_6 (15.2), C_3H_8 (68.7), C_4H_{10} (8.2), CH_3OH (24.2), phenol (63.8), methoxybenzene (38.6), *p*-methoxytoluene (19.6)	168
–, 3-methyl-	309–399	44.4% monomer, 7.3% xylene, 48.3% larger chain fragments	3
–, 4-methyl-	200–350	Ratio of monomer to oligomer rises from 40% at 200°C to 95% at 350°C	79
	560	C_1–C_4 hydrocarbons, benzene, toluene, ethylbenzene, styrene, ethyltoluene, vinyltoluene, naphthalene, ethylstyrene	278
Poly(*o*-propionylstyrene)	385	CO, CH_4, ethane, ethene, butane, 2-propionylstyrene, 2-propionyltoluene, styrene, toluene, α-methylstyrene, α-methyl-2-propionylstyrene, various dimeric and trimeric species not fully characterized	313
–, α-methyl-	200–500	95–100% monomer	28
	520–1200	Fragments both larger and smaller than monomer appear in increasing amounts the higher the temperature, particularly CH_4, C_2H_4, and C_6H_6 until at 1200°C the monomer yield is only 33.9%	28
	Ambient	Gamma radiolysis: CH_4 (1.0 relative mass spec. ion current) C_2H_6 (1.2), C_3H_4 (6.7), C_3H_6 (1.8), C_3H_8 (2.7), C_4H_4 (22), C_4H_{10} (9.9), cyclopentadiene (6.1), benzene (72.8), toluene (20), styrene (50.5), α-methyl styrene (184), isopropyl benzene (10)	168
	400–900	Benzene, toluene, ethylbenzene, cumene, styrene, α-methyl styrene, indene/phenylpropyne, methyl-1,2-dihydronaphthalene, methylene indene, naphthalene, 2-methylnaphthalene, 1-methylnaphthalene, biphenyl, anthracene/phenanthrene, dihydropyrene	169
–, *p*-*N*,*N*-diethylamino-	350–500	Toluene, styrene, *p*-ethylstyrene, *N*,*N*-diethyl-*p*-toluidine, *N*,*N*-diethyl-*p*-ethylaniline, *p*-*N*,*N*-diethylaminostyrene, α-methyl-*N*,*N*-diethylaminostyrene, 2-(*p*-*N*,*N*-diethylaminophenyl) butane, α-propyl-*p*-*N*,*N*-diethylaminostyrene, *N*-ethyl-*p*-toluidine, *N*-ethyl-*p*-toluidine, *N*-ethyl-*p*-ethylaniline, *N*-ethyl-*p*-aminostyrene and closely related compounds	170
–, *m*-*N*,*N*-dimethylamino-	350–500	*m*-*N*,*N*-Dimethylaminostyrene, *N*,*N*-dimethyl-*m*-toluidine, *m*-xylene, styrene, *N*,*N*-dimethyl-*m*-ethylaniline, toluene, *m*-methylstyrene, α-methyl-*m*-*N*,*N*-dimethylaminostyrene, *trans*-β-methyl-*m*-*N*,*N*-dimethylaminostyrene, α-ethyl-*m*-*N*,*N*-dimethylaminostyrene, *N*-methyl-*m*-toluidine, *N*-methyl-*m*-ethylaniline, *N*-methyl-*m*-aminostyrene, oligomers of *m*-*N*,*N*-dimethylaminostyrene and closely related compounds	171

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
–, *p*-*N*,*N*-dimethylamino-	500 for 30 min	*N*,*N*-dimethylaniline (0.2% of original polymer weight), *N*,*N*-dimethyl-*p*-toluidine (2.8%), *N*-methylaniline (0.4%), *N*,*N*-dimethyl-*p*-ethylaniline (0.4%), *N*-methyl-*p*-toluidine (0.4%), *N*-methyl-*o*-toluidine (0.4%), *p*-toluidine (0.4%), *N*-methyl-*p*-ethylaniline (0.4%), *p*-*N*,*N*-dimethyl-aminostyrene (36.3%), α-methyl-*p*-*N*,*N*-dimethylaminostyrene (0.7%)	172
Poly(*p*-(2,4-dichlorobenzyl)styrene)	Ambient to 500	Benzene, toluene, ethylbenzene, styrene, α-methylstyrene, 1,3-dichlorobenzene, 2,4-dichlorotoluene, monomer (major product), complex series of halogenated and dehalogenated chain fragments (see Ref.)	275
–, *p*-isopropyl-α-methyl-	Ambient	Gamma radiolysis: CH_4 (8, relative mass spec. ion current), C_2H_4 (4.6), C_3H_4 (7.2), C_3H_6 (21.2), C_3H_8 (108), C_4H_{10}, (57.4)	168
–, 2,3,4,5,6-pentafluoro-	390–446	63% of the products are volatile at 25°C – contains some monomer	67
–, α,β,β-trifluoro-	333–382	72% monomer, 28% larger chain fragments	14
Polystyrene (chain brominated on α-position)	150–300	HBr, trace styrene	271
	300–500	Styrene, HBr, toluene, benzene	271
	Ambient to 500	HBr, styrene, traces of toluene and benzene, *p*-bromostyrene	271
Poly(styrene-*co*-methylene) $\sim\sim CH(\phi)-CH_2-CH_2-CH(\phi)-(CH_2)_n\sim\sim$, n = 0,1,3,4 and 5	350 for 4 hr	Benzene, toluene, ethylbenzene, styrene (major volatile product), *n*-propylbenzene (except with $n = 2$), phenylpropene, butylbenzene (except with $n = 0$), phenylbutene (with $n = 4$ and 5 only), amylbenzene (with $n = 4$ and 5 only) hexylbenzene (with $n = 4$ and 5 only), chain fragment fraction (major product)	173
Poly(styrene-*co*-SO_2) (1.85 : 1)	200	At 26.7 mbar pressure; 40% weight loss; main product is 2,4-diphenyl thiophene; at least 11 unidentified minor products	68
Poly(styrene-*co*-methacrylic acid) 18, 44 and 72 mol% MAA	Ambient to 500	CO_2, H_2O, butene, isobutene, dimethyl ketene, styrene, methacrylic acid, succinic-type 5-membered cyclic anhydrides	294
Poly(styrene-*co*-chlorotrifluoroethylene) 7.7, 14, 20 mol% CTFE	Ambient to 500	Chlorotrifluoroethylene, styrene, HCl, chloropentafluoropropene, ethene, chloroethene, toluene, α-methylstyrene, dimer and trimer structures with some unsaturation; SiF_4 (from reaction of HF with glass). Distribution of products varies with polymer composition	261
Poly(styrene-*co*-glycidyl methacrylate) 10, 23, 51, 62, 78, 86 mol% GMA	Ambient to 500	CO, CO_2, propene, isobutene, dimethyl ketene, acrolein, allyl alcohol, toluene, styrene, α-methylstyrene, ethylbenzene, glycidol, glycidylmethacrylate; product distribution depends on copolymer composition	264
Poly(styrene-*co*-phenyl methacrylate) 10–90 mol% PMA	Ambient to 500	CH_4, CO, CO_2, propene, dimethyl ketene, toluene, styrene, 4-phenylbutene, 4-phenyl-2-methylbutene, phenyl methacrylate, α-methylstyrene, short chain fragments	280
Poly(styrene-*co*-1,2,2,2,-tetra-chloroethyl acrylate) (4.7/1)	310 and 500	Styrene, benzene, toluene, ethylbenzene, α-methyl styrene, diphenyl, 5,6-benzo-2-methyl-3,5-cyclohexadienone, diphenylethane, 1,3-diphenylpropane, dimers and trimers of styrene, chloroacetaldehyde, dichloroacetaldehyde, trichloroacetaldehyde, trichloropropanal	174
Poly(styrene-*co*-1,2,2,2-tetra-chloroethyl methacrylate) (3.8/1)	310 and 500	Styrene, benzene, toluene, allylbenzene, α-methylstyrene, indane, iso-propenylstyrene, 5,6-benzo-2-methyl-3,5-cyclo-hexadienone, propyl-propenylbenzene, diphenylethane, 1,3-diphenylpropane, dimers and trimers of styrene chloroacetaldehyde, dichloroacetaldehyde, trichloroacetaldehyde, trichloropropanal, benzyl chloride, 2-chloroethylstyrene, 2,2-dichloroethenyl methacrylate, 1,2,2,2-tetrachloroethyl methacrylate	174
Poly(styrene-*co*-bis-(1,2,2,2-tetra-chloroethyl)fumarate) (8.9/1)	310 and 500	Styrene, benzene, toluene, ethylbenzene, allylbenzene, α-methylstyrene, indane, diphenyl propylpropenylbenzene, diphenylethane, 1,3-diphenylpropane, dimers and trimers of styrene, chloroacetaldehyde, dichloroacetaldehyde, trichloroacetaldehyde, benzyl chloride	174
Poly(styrene-*co*-bis-(1,2,2,2-tetra-chloroethyl) muconate) (7.72/1)	310 and 500	Styrene, benzene, toluene, ethylbenzene, α-methylstyrene, diphenyl, propylpropenylbenzene, diphenylethane, 1,3-diphenylpropane, dimers and trimers of styrene, chloroacetaldehyde, dichloroacetaldehyde, trichloroacetaldehyde, trichloropropanal, benzyl chloride	174
Poly(styrene-*co*-*N*-(2,4,6-tribromophenyl)-maleimide) (6.4/1)	310 and 500	Styrene, benzene, toluene, ethylbenzene, allylbenzene, α-methylstyrene, indane, diphenylethane, 1,3-diphenylpropane, dimers and trimers of styrene, *N*-(2,4,6-tribromophenyl) maleimide, *N*-dibromophenyl maleinimide	174

References page II-475

TABLE 1. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(styrene-*co*-*N*-(pentachlorophenyl)-maleimide) (4.9/1)	310 and 500	Styrene, benzene, toluene, ethylbenzene, allylbenzene, α-methylstyrene, indane, diphenylethane, 1,3-diphenylpropane, dimers and trimers of styrene, pentachlorophenyl isocyanate, *N*-pentachlorophenyl formamide, *N*-tetrachlorophenyl maleinimide, *N*-(pentachlorophenyl) maleimide, methyl maleic acid pentachlorophenylimide	174
Poly(styrene) 1 : 1 (w/w) *blend* with bisphenol A polycarbonate	Ambient to 500	CO_2 styrene, α-methylstyrene, *p*-cresol, phenol, *p*-ethylphenol, *p*-vinylphenol, *p*-isopropylphenol, polystyrene short chain fragments with vinylidene and saturated ends, polycarbonate cyclic dimer and chain fragments, bisphenol A	272
Poly(vinyl toluene-*co*-divinyl benzene) 10-50% DVB	560	C_1–C_4 hydrocarbons, benzene, toluene, ethylbenzene, styrene, ethyltoluene, α-methylstyrene, vinyltoluene, divinylbenzene, naphthalene, ethylstyrene; distribution varies with copolymer composition	278
Poly(4-methoxystyrene) 1 : 1 (w/w) *blend* with bisphenol A polycarbonate	Ambient to 500	CO_2, 4-methoxystyrene, α-methyl-4-methoxystyrene, *p*-cresol and other phenols in small amounts, poly(4-methoxystyrene) dimer and trimer with vinylidene and saturated ends, polycarbonate cyclic dimer and chain fragments, bisphenol A	272

TABLE 2. MAIN-CHAIN CARBOCYCLIC POLYMERS

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly((E,E)-[6.2]paracyclophane-1,5-diene)	460, 515, 620	Primary product is monomer; in addition, a series of secondary products based on ring-opened monomer are formed by H-abstraction (see Ref.); also detected: toluene (not 460°C) and *p*-xylene	251
Poly(perfluoro-*m*-phenylene)	700	Volatiles comprise SiF_4 (from silica vessel), CO_2, with traces of C_6F_6 and C_6F_5H; white sublimate on vessel walls; residue contains 1% fluorine	50
Poly(perfluoro-*p*-phenylene) high molecular weight (15000)	700	Volatiles comprise SiF_4 (from silica vessel), CO_2, with traces of C_6F_6 and C_6F_5H; white sublimate on vessel walls; residue contains 1% fluorine	50
low molecular weight (3700)	700	Volatiles comprise SiF_4 (from silica vessel), CO_2, with traces of C_6F_6 and C_6F_5H; no white sublimate; residue contains 33–41% fluorine	50
Poly(1,4-phenylene)	250–620	79% residue, 10% chain fragments, 11% volatiles comprising H_2, CH_4, H_2O, HCl (from catalyst)	55
–, 2-hydroxy-	300–620	60% residue, 24% chain fragments, 16% volatiles comprising CO, CO_2 H_2, CH_4	55
Poly(1,4-phenylene ethylene)	420–465	3.6% of products are volatile at 25°C and consist of 2.83% xylene, 0.29% toluene, 0.28% methylethyl benzene, 0.14% methylstyrene, 0.06% benzene, products involatile at 25°C consist of dimeric–octameric fragments	13,14,80
	408–515	Mainly chain fragments (dimer–pentamer); traces of H_2, monomer	81
	436–475	H_2, CH_4, C_2H_4, C_2H_6, toluene, *p*-xylylene, *p*-ethyltoluene, *p*-methylbibenzyl, 1,2-di-*p*-tolylethane, 4,4′-dimethylstilbene	176
Poy(1,3-phenylene-hexafluoro-trimethylene	660 for 30 s	C_2F_4 (21.6% of original weight of polymer), HF (17),  (13.9%), $C_6H_5(CF_2)_5C_6H_5$ (10.2%), C_6H_6 (8.5%), $C_6H_5(CF_2)_3C_6H_5$ (7.9%)	177
Poly(1,4-phenylenemethylene)	386–416	7.4% of products are volatile at 25°C; 5.9% toluene, 1.4% benzene, 0.1% xylene	13,14
Poly α-(ethoxycarbonyl-vinyl)-ω-[4-(ethoxycarbonyl-vinyl)-phenyl] (1,4-phenylene-2,4-bis-ethoxycarbonyl-1,3-cyclobutylene) 	320–360 for 1 h under N_2	Low-molecular-weight polymer and small amount of monomer	195

TABLE 3. MAIN-CHAIN HETEROATOM POLYMERS

Polymer	Temperature range (°C)	Degradation products	Refs.
3.1. POLY(OXIDES) AND POLY(KETONES)			
Poly(fluoro ethers)	510–540		178
a. $-[O-CH_2-(CF_2)_3CH_2O-CH_2]_n-$		$CH_3-(CF_2)_3CH_2-OCH_3$ (46.9%) relative areas of glc traces, $CH_3(CF_2)_3CH_3$(14%), $CH_3CF_2CF_2H$ (6.7%), $CF_2=CH_2$ (6.7%), CF_2H-CF_2H (2.3%)	
b. $-[OCH_2(CF_2)_3CH_2O$-*p*-$C_6F_4]_n-$		$CF_2=CH_2$ (17.0%), $CH_3(CF_2)_3H$ (16.5%), CF_2HCF_2H (6.4%), $CH_3CF_2CF_2H$ (4.1%), C_6F_5H (9.6%),  (9.4%), C_6F_5CHO (7.2%), C_6F_4HCHO (4.9%), $C_6F_4H_2$ (3.3%)	
c. $-[OCH_2(CF_2)_3CH_2O$-*p*-C_6F_4-*p*-$C_6F_4]_n-$		HF (31%), $CF_2=CH_2$ (22.0%), $CH_3(CF_2)_3H$ (19.7%), CF_2HCF_2H (10.1%), $C_6F_5C_6F_4H$ (5.6%),  (8.1%), $C_6F_4HC_6F_4H$ (9.3%)	
d. $-[OCH_2(CF_2)_3CH_2O$-*m*-$C_5NF_5]_n-$		HF (50%), $CH_3(CF_2)_3H$ (27.6%), $CF_2=CH_2$ (7.8%), CF_2HCF_2H (4.3%),  (5.6%), $C_5NF_3H_2$ (3.1%)	
Poly(oxybutylethylene)	321–365	Mixture of saturated and hydrocarbons (C_1–C_6), aldehydes (C_1–C_6), H_2, H_2O	20
Poly(oxy-2,5-dimethoxy-1,4-phenylene)	100–550	41% residue, 29% fragments, 30% volatiles comprising H_2, CH_4, CO, CO_2, CH_3OH, traces of H_2O, C_2H_6, other hydrocarbons	55
Poly(oxy-2,6-dimethyl-1,4-phenylene)	100–550	26% residue, 66% chain fragments, 8% volatiles comprising H_2, CH_4, H_2O, CO, CO_2	55
	400–550	*o*-Cresol, 2,6-dimethyl phenol, 2,4-dimethyl phenol, 2,4,6-trimethyl phenol, various ketones, dimers, and more complicated structures (see Ref.), various combinations of the monomeric skeletons	179
Poly(oxyethylene)	324–363	9.7% of products volatile at 25°C–3.9% monomer with smaller amounts of CO_2, formaldehyde, ethanol, and saturated and C_1–C_7 compounds	25
	280	Diethyl ether, ethyl methyl ether, acetaldehyde, formaldehyde, CO_2, CO, ethene, cyclohex-3-ene-1-one	252
Poly(oxymethylene)	222	100% Monomer	27
	100–180	100% Formaldehyde; inverse relationship between molecular weight and rate for hydroxyl terminated polymers; acetylation of terminal hydroxy groups inhibits the reaction	181
Poly(oxymethyleneoxyethylene)	314–338	Major volatile products CH_4, C_2H_6, C_2H_4, C_2H_2, $HCO_2C_2H_5$	20
Poly(oxy-2-methylphenylene)	250–500	*p*-Xylene, phenol, 2-methylphenol, 4-methylphenol, 2,4-dimethylphenol, and a variety of more complex structures (see Ref.)	180
Poly(oxy-1,3-phenylene)	300–620	34% Residue, 53% chain fragments, 13% volatiles comprising H_2O, CO, H_2, CH_4, CO_2, trace of C_6H_6	55
Poly(oxy-1,4-phenylene)	550	Hydroquinone, phenol, benzene, diphenylether, 4,4′-dihydroxydiphenylether, 4-phenoxyphenol. In addition, a broad spectrum of phenyl and phenolic terminated oligomers with up to 10 aromatic units	255
	585	As 550°C plus dibenzofuran and dibenzofuran-containing oligomers	255
Poly(oxy-1,4-phenylene)-*blend*-polystyrene (60 : 40)	300–360	Ethylbenzene, styrene, α-methylstyrene, 2-methylphenol, 2,6-dimethylphenol, 2,4-dimethylphenol, 2,4,6-trimethylphenol, 1,3-diphenylpropane, 2,4-diphenyl-1-butene, 2,4,6-triphenyl-1-hexene, PPO dimers	318
Poly(oxypropylene) atactic	270–330	12.8% of products volatile at 25°C, including 4.00% acetaldehyde, 2.22% acetone, 1.43% dipropyl ether and 0.75% propylene	25
isotactic	275–355	20% of products volatile at 25°C, including 6.34% acetaldehyde, 2.39% acetone, 2.19% dipropyl ether, and 2.22% propylene	25
Poly(oxytetramethylene)	347	Volatiles comprise a mixture of CH_4, C_2H_6, C_3H_8, C_4H_{10}, C_2H_4, C_3H_6, CH_3CHO, C_2H_5CHO, C_3H_7CHO	20
Poly(oxytrichloromethyl methylene) (Poly(trichloro acetaldehyde))	Ambient	Monomer	182

TABLE 3. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(oxy-1,4-phenylene-carbonyl-1,4-phenylene) (Poly(ether ketone), PEK)	390, 490, 530	Low MW polymer at 490°C produces benzene, phenol, benzaldehyde, 4-hydroxybenzaldehyde, diphenyl ether, biphenylene, benzophenone, series of –H, –OH and –CHO terminated chain fragments containing <8 aromatic units and fragments containing dibenzofuran units. High MW polymer at 530°C as above. Low MW polymer at 390°C produces significant quantities of 4-hydroxy benzaldehyde and benzophenone-4,4′-diol	250
	506	Phenol, dibenzofuran, benzofuran derivatives, mixtures of oligomers mostly hydroxy terminated	315
Poly(oxy-1,4-phenylene-oxy-1,4-phenylene -carbonyl-1,4-phenylene) (Poly(ether ether ketone), PEEK)	506	Phenol, dibenzofuran, benzofuran derivatives, mixtures of oligomers mostly hydroxy terminated	315
Poly(etherketone-*co*-ethersulphone) Mole ratio 1 : 3, 3 : 1, 1 : 1 (random), 1 : 1 (alternating)		All polymers have same products with distribution varying with composition. Biphenyl, hydroquinone, 4-phenoxyphenol, benzaldehyde, 4-hydroxybenzaldehyde, diphenyl sulphone, diphenylether, phenol, benzophenone-4,4′-diol. Also two series of chain fragments containing PEK and PES units with –H, –OH and –CHO ends. Analogous fragments with biphenyl units	250
3.2. POLY(ESTERS)			
Poly(3-oxybenzoyl)	330	Monomer, cyclic dimer–heptamer	187
Poly(4-oxybenzoyl)	505–565	CO, CO_2, phenol, *p*-hydroxy phenyl benzoate	197
Poly(oxycarbonyl-1,3-phenylene-hexafluoroisopropylidene-1,3-phenylene carbonyloxy-1,3-phenylene-hexafluoro-isopropylidene-1,3-phenylene)		HF (12%), cyclic structures (see Ref.)	177
Poly(oxycarbonyl-1-chloroisopropylidene)	253–384	HCl and a compound with a glycollidic structure	185
Poly(oxycarbonylcyclohexylidene)	200–500	Cyclohexen-1-carboxylic acid, cyclohexanone	198
Poly(oxycarbonylcyclopentylidene)	200–500	Cyclopenten-1-carboxylic acid, cyclopentanone, dicyclopentyl glycollide	198
Poly(oxycarbonyl-3-pentylidene)	200–300	*Cis*- and *trans*-2-ethyl crotonic acid (major products)	188
Poly(oxyethyleneoxyterephthaloyl) (Poly(ethylene terephthalate))	283–306	Acetaldehyde major gaseous product with CO_2, CO, C_2H_4, H_2O, CH_4, benzene, 2-methyl-dioxolane, terephthalic acid, and more complex chain fragments	26
	900	CO, CH_4, CO_2, ethylene, acetylene, ethane, H_2O, propylene, ethanal, acetone, propanal, ethanol, benzene, toluene, ethyl benzene, styrene, *p*-vinyl toluene, benzaldehyde, *p*-ethyl toluene, acetophenone, methyl benzoate, vinyl benzoate, ethyl benzoate, *p*-methyl acetophenone, benzoic acid, *p*-methyl vinyl benzoate, *p*-vinyl acetophenone, propyl benzoate, *p*-ethyl vinyl benzoate, *p*-vinyl vinyl benzoate, biphenyl, 1-hydroxy ethyl benzoate, diacetyl benzene, *p*-acetyl vinyl benzoate, divinyl terephthalate, ethyl vinyl terephthalate, ethyl vinyl terephthalate, *p*-acetyl benzoic acid, methyl 1-hydroxyethyl terephthalate, ethylene dibenzoate	192
	Ambient to 500	CO, CH_4, CO_2, ethene, ketene, acetaldehyde, 1,4-dioxane, toluene, benzaldehyde, vinylbenzoate, divinylterephthalate, benzoic acid, terephthaldehydic acid, terephthalic acid, hydroxyethyl methyl terephthalate, short chain fragments	298
Polyester from terephthaloyl chloride and $n = 4$ polyethylene glycol	Ambient to 500	CO, CH_4 (trace), CO_2, ethene (trace), formaldehyde, acetaldehyde, 1,3-dioxalane, ethoxyacetaldehyde, 1,4-dioxane, glycidol, diethylether, 1,2-dimethoxyethane, 2-methoxyethanol, 2-ethoxyethanol, $-CH_2CH_2COCH_2-$(ring), $HOCH_2CH_2OCH_2CHO$, $CH_3OCH_2CH_2OC_2H_5$, terephthalic acid, triethylene glycol, tetraethylene glycol, chain fragments	274
Polyester from terephthaloyl chloride and $n = 22$ polyethylene glycol		CO, CH_4 (trace), CO_2, ethene (trace), formaldehyde, acetaldehyde, 1,3-dioxalane, methoxyacetaldehyde, 1,4-dioxane, 7-membered cyclic ether, methyl benzoate, ethyl benzoate, benzaldehyde, $-CH_2CH_2COCH_2-$(ring), $HOCH_2CH_2OCH_2CHO$, $CH_3OCH_2CH_2OC_2H_5$, $-(CH_2CH_2O)_2CH_2CO-$(ring), $CH_2{=}CHOCH_2CH_2OCH_2CHO$, $HO(CH_2CH_2O)_2C_2H_5$, $C_2H_5(OCH_2CH_2)_3H$, terephthalic acid, triethylene glycol, tetraethylene glycol, chain fragments	274

TABLE 3. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(oxyisophthaloyl-oxy-1,3-phenylene)	330	Cyclic monomer (10 relative abundance), cyclic dimer (83.5), cyclic trimer (24.5), benzoic acid, isophthalic acid, resorcinol and various fragments of the main chain (see Ref.)	187
Poly(oxyisophthaloyl-oxy-1,4-phenylene)	330	Cyclic dimer (17), cyclic trimer (4), *m*-phthalic acid (26), benzoic acid (7.5), hydroquinone (46), and various fragments of the main chain (see Ref.)	187
Poly(oxy-1-oxohexamethylene)	220	Monomer (ε-caprolactone)	184
Poly((D)-oxy-1-oxo-3-methyl-trimethylene) (Poly(3-hydroxybutyrate))	Ambient to 338	Dimer (41.2 wt.%), crotonic acid (35.3), trimer (12.5), tetramer (2.9), iso-crotonic acid (0.9). Small amounts of CO_2, propene, ketene, acetaldehyde, and β-butyrolactone are formed at higher temperatures due to decomposition of primary products	186
	250	Crotonic acid (64.4% of original polymer), dehydrated dimer (7.2%), dehydrated trimer (1.2%)	245
	400	Crotonic acid (65.4% of original polymer), dehydrated dimer (8.2%), dehydrated trimer (2.1%)	245
	600	Crotonic acid (58.3% of original polymer), dehydrated dimer (9.0%), dehydrated trimer (2.7%)	245
	350	Crotonic acid (*trans*), dehydrated dimer (*trans*), dehydrated trimer and tetramer (*cis*/*trans* not resolved)	246
Poly((D)-oxy-1-oxotetramethylene) (Poly(4-hydroxybutyrate))	320	Cyclic oligomers (γ-butyrolactone and higher homologues)	257
Poly(oxy-1-oxo-2-methylethylene) (Poly(l-lactic acid))	500	CO, CO_2, acetaldehyde, acetone, acrylic acid, acetic acid, DL-lactide, meso-lactide, cyclic oligomers up to nonamer, 2,3 pentanedione (?), lactoyl lactic acid (?)	282
Poly(oxy-1-oxo-2,2-dimethyltrimethylene (Poly(α,α-dimethyl-β-propiolactone))	250–600	Isobutylene and CO_2	183
Poly(oxy-1-oxo-trimethylene) (Poly(β-propiolactone))	180–220	Acrylic acid	189
Poly(oxyterephthaloyloxy-1,2-phenylene)	Ambient to 500	CO_2, benzene, phenol, benzaldehyde, catechol, cyclic dimer	285
Poly(oxyterephthaloyloxy-1,3-phenylene)	345	Cyclic dimer (2), cyclic trimer (0.3), terephthalic acid (0.4), benzoic acid (1.5), resorcinol (20) and various fragments of the main chain (see Ref.)	187
	Ambient to 500	CO_2, benzene, phenol, benzaldehyde, biphenyl, benzoic acid, 3-hydroxyphenylbenzoate, resorcinol, mono and di(3-hydroxyphenyl) terephthalate, terephthalic acid, terephthaldehydic acid, short chain fragments	285
Poly(oxyterephthaloyloxy-1,4-phenylene)	350	Cyclic dimer (0.1), terephthalic acid (0.5), benzoic acid (6), hydroquinone (40.5), and various fragments of the main chain (see Ref.)	187
	Ambient to 500	Benzene, phenol, benzaldehyde, biphenyl, benzoquinone, 4-hydroxyphenylbenzoate, benzoic acid, mono and di(4-hydroxyphenyl) terephthalate, terephthalic acid, terephthaldehydic acid, short chain fragments	285
Poly(oxyterephthaloyloxy-4,4′-diphenylene)	Ambient to 500	CO_2, benzene, phenol, benzaldehyde, biphenyl, 4-phenylphenol, *p,p′*-dihydroxybiphenyl, 4-hydroxybiphenylbenzoate, di(4-hydroxybiphenyl) terephthalate	285
Poly(oxytetramethyleneoxyterephthaloyl) (Poly(butylene terephthalate))	240–280	Butadiene, terephthalic acid, mono-3-butenyl terephthalate, and di-3-butenyl terephthalate	190
	200–400	Tetrahydrofuran, 1,3-butadiene, CO_2, CO, H_2O, benzoic acid, terephthalic acid, terephthalic acid mono-3-butenyl, toluene, phenol, benzene	191
	Ambient to 500	CO, CO_2, butadiene, tetrahydrofuran, toluene, benzene, 1,5-hexadiene, dihydrofuran, 4-vinyl cyclohexene, 1,4-butane diol, benzaldehyde, benzoic acid, terephthaldehydic acid, terephthalic acid, mono-3-butenyl terephthalate, cyclic dimer, short chain fragments	298
Poly(oxydecamethylene-oxyterephthaloyl)	Ambient to 500	CO, CO_2, 1,9-decadiene, 1,10-decane diol, 1-decene-10-ol, benzoic acid, terephthalic acid, mono-decenyl terephthalate	298
Poly(oxyethyleneoxyadipoyl)	Ambient to 500	Cyclic oligomers, CO, CO_2, acetaldehyde, 2-ethylacrolein	269
Poly(oxytetramethylene-oxysebacoyl)	Ambient to 500	CO_2, H_2O, butadiene, tetrahydrofuran	299
Polyester from maleic anhydride, hexolic acid and butanediol; mole ratio 1 : 1 : 2.2	100–440	Tetrahydrofuran, 1-butanol, toluene, maleic anhydride, chlorosuccinic acid isomers, chlorovalerolactone isomers, hydroxypyran, allylpyran, trichlorocylopentadiene, tetrachlorocylopentadiene, pentachlorocylopentadiene, hexachlorocylopentadiene, phthalic anhydride, 1,4-butanediol, 1,4-butanediol dibenzoate, benzoic acid, 4-cyclohexene-1,2-dicarboxylic acid anhydride, benzoic acid butenyl ester, cyclohexadiene carboxylic acid propyl ester, hexolic anhydride,	311

TABLE 3. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
		unidentified butenyl ester, compound containing C_5HCl_5 unit, CH_3–CH=CH–CH_2–O–CH_3, CH_3–CH=CH–CH_2–O–CH=CH_2, Cl–CH=CH–O–CH_2–CH_3	
Polyester from maleic anhydride, phthalic anhydride and butanediol; mol ratio 1:1:2.2	100–440	Tetrahydrofuran, 1-butanol, 3-butene-1-ol, toluene, maleic anhydride, phthalic anhydride, 1,4-butanediol, 1,4-butanediol dibenzoate, phthalic acid butenyl ester, various esters containing butenyl, maleate and phthalate units, CH_3–CH=CH–CH_2–O–CH_3, CH_3–CH=CH–CH_2–O–CH=CH_2	311
Unsaturated polyester resins	300–800		
a. Maleic acid–phthalic acid–propylene glycol–styrene		Ethane (above 600°C), propionaldehyde (above 400°C), styrene (major product), phthalic anhydride (major product), benzene (above (450°C), toluene (above 500°C), xylene (above 400°C)	193
b. Maleic acid–tetrabromophthalic acid–phthalic acid–propylene glycol–styrene		Styrene (major product), phthalic anhydride (major product), benzene (above 550°C), toluene (above 450°C), xylene (above 500°C)	193
c. Maleic acid–phthalic acid–dibromoneopentyl glycol–styrene		Ethane (above 500°C), propionaldehyde (above 400°C), styrene (major product), phthalic anhydride (major product), benzene (above 500°C), toluene (above 500°C), xylene (above 500°C)	193
3.3. POLY(CARBONATES)			
Poly(oxycarbonyloxy-1,3-phenylene)	270	Cyclic trimer, tetramer, and pentamer, and various chain fragments	226
Poly(oxycarbonyloxy-1,4-phenyleneisopropylidene-1,4-phenylene)	300–389	Major products: CO_2, bisphenol A; minor products: CO, CH_4, 4-alkyl phenols	60
	200–400	CO, CO_2, CH_4, phenol, diphenyl carbonate, 4-(4-hydroxyphenyl)-2-phenyl propane	225
	290	Cyclic dimer, cyclic trimer, bisphenol A, and other chain fragments	226
	Ambient to 500	CO, CH_4, CO_2, H_2O, phenol, *p*-cresol, *p*-ethyl phenol, *p*-isopropyl phenol, *p*-vinyl phenol, bisphenol A, cyclic dimer, chain fragments including some ester structures	304
	300	Phenol, *p*-cresol	304
	375	CO_2, phenol, *p*-cresol	304
Poly(oxycarbonyloxy-1,4-phenylene-isopropylidene-1,4-phenylene-oxy-carbonyl-tetramethylene)	240	Cyclic monomer and dimer, and higher cyclic fragments	226
Poly(oxycarbonyloxy-1,3-phenylene hexafluorotrimethylene-1,3-phenylene)		HF (3%), cyclic dimer	177
Poly(oxycarbonyloxy-1,4-phenylene-oxycarbonyloxy-tetramethylene)	270	Cyclic dimer and trimer, and higher cyclic fragments	226
Poly(oxycarbonyloxy-1,4-phenylene-phthalidylidene-1,4-phenylene)	350	CO_2, CO, O_2, H_2O, phenol, fluorenone, diphenyl carbonate, xanthone, anthraquinone, 2-hydroxyanthraquinone, 2-benzoxyanthraquinone, phenolphthalein, traces of benzoxyphenol and hydroquinone	227
Poly(trimethylene carbonate)	*Ambient to 500*	CO_2, H_2O (possibly desorbed), trimethylene carbonate, cyclic oligomers	295
Poly(neopentylene carbonate)	Ambient to 500	CO_2, monomer, oligomer	296
Poly(2-phenyl trimethylene carbonate)	Ambient to 500	CO, CO_2, H_2O (possibly desorbed), α-methylstyrene, chain fragments (85%, w/w)	296
3.4. POLY(ANHYDRIDES)			
Poly(oxycarbonyl-1,3-phenylene-hexafluorotrimethylene-1,3-phenylene-carbonyl)	350	Cyclic dimer	177
Poly(maleic anhydride-*co-trans* stilbene) (alternating copolymer)	Ambient to 500	CO_2, styrene, maleic anhydride; small amounts benzene, cyclohexadiene, dimethylbutene, ethylcyclobutanol and 4-methoxystyrene; major products (79%) are chain fragments, including aromatic, ketonic and unsaturated structures	242
3.5. POLY(SULFIDES) AND POLY(SULFONES)			
Poly(thioacetone)	145	Main product is cyclic trimer [$(CH_3)_2CS$]	69
Poly(thioethylene)	220–260	Ethylene, H_2S, ethanethiol	199
Poly(thio-1,4-perfluorophenylene)	500	73% Residue; remainder, chain fragments, H_2, SiF_4 (from silica vessel), CO_2	51
Poly(thiomethylene-1,4-phenylene-methylene)	250–350	Sulphur, styrene, thiobenzaldehyde, 4-methyl styrene, *p*-xylene, 4-ethyl toluene, H_2S, 4-methyl thiobenzaldehyde, stilbene and chain	254

TABLE 3. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
		fragments containing stilbene units, chain fragments containing polymer repeat units with $-CH_2SH$, $-CH{=}S$ and $-CH_3$ terminal units	
	650	Toluene, ethylbenzene, *p*-xylene, 1,4-diethylbenzene, 4-ethyltoluene; series of polycyclic aromatics containing phenanthrene and dihydrophenanthrene	254
Poly(dithiomethylene-1,4-phenylene-methylene)	250–350	Sulphur, styrene, thiobenzaldehyde, 4-methyl styrene, *p*-xylene, 4-ethyl toluene, H_2S, 4-methyl thiobenzaldehyde, stilbene and chain fragments containing stilbene units, chain fragments containing polymer repeat units with $-CH_2SH$, $-CH{=}S$ and $-CH_3$ terminal units	254
	650	Toluene, ethylbenzene, *p*-xylene, 1,4-diethylbenzene, 4-ethyltoluene; series of polycyclic aromatics containing phenanthrene and dihydrophenanthrene	254
Poly(thio-1,2-phenylene)	430	Cyclic dimer (thianthrene), some cyclic trimer	258
Poly(thio-1,3-phenylene)	540	Cyclic oligomers (trimer to heptamer) in decreasing yield	258
Poly(thio-1,4-phenylene)	460	72% Residue; remainder chain fragments, H_2, dibenzthiophene	51
	300–620	38% Residue, 47% chain fragments, 15% volatiles comprising mainly H_2S and H_2	59
	325–625	Benzene, thiophenol, diphenyl, diphenylsulfide, dibenzothiophene, chlorobenzene (from polymers with terminal chlorine atoms)	200
	560	Cyclic oligomers tetramer to heptamer (pentamer dominates)	258
Poly(oxy-1,4-phenylene-sulfonyl-1,4-phenylene-oxy-1,4-phenylene-isopropylidene-1,4-phenylene) 	380	Phenol with smaller amounts of *p*-cresol, *p*-ethyl phenol, *p*-isopropyl-phenyl phenol, bisphenol A, diphenyl ether, *p*-tolyl phenyl ether, *p*-ethyl diphenyl ether, *p*-isopropenyl diphenyl ether, isomers of tolyl (ethyl–phenyl)ether	201
	350–450	In 90 min at 450°C, 15% (of initial weight) of gaseous products are formed; SO_2 (76% of gaseous products), CO_2 (15%), CO (4.5%), CH_4 (4.5%)	202
	470 for 2 h	Benzene, toluene, *p*-xylene, isopropylbenzene, phenol (main product), diphenyl oxide, diphenyl sulfide	203
	800	SO_2, benzene, toluene, styrene, phenol, methylphenol, diphenylether, methyl diphenylether	288
Poly(oxy-1,4-phenylene-sulfonyl-1,4-phenylene)	470 for 2 h	Phenol (main product), diphenyl oxide	203
	550–600	SO_2, diphenylsulfone, phenol, diphenylether, hydroquinone, benzenesulfonic acid, 4-hydroxybenzenesulfonic acid, 4,4′-dihydroxydiphenylether, 4-phenoxyphenol; series of –H and –OH terminated fragments up to trimer, series of compounds containing consecutive diphenylether and dibenzofuran units, fragments containing biphenyl units as a result of SO_2 elimination; complex ring structures with sulfonate links	255
	800	SO_2, benzene, phenol, diphenyl ether, dibenzofuran	288
Poy(tris-(oxy-1,4-phenylene)-sulfonyl-1,4-phenylene)		Benzene, phenol (major product), diphenyl oxide, *p*-hydroxydiphenyl, or *p*-hydroxydiphenyl oxide	203
Poly(oxy-4,4′-diphenylene-oxy-1,4-phenylene sulfonyl-1,4-phenylene)		Phenol (main product), diphenyl oxide	203
Poly(oxy-1,4-phenylene-sulfonyl-1,4-phenylene-oxy-1,4-phenylenemethylene-1,4-phenylene)		Benzene, toluene, *p*-xylene, phenol (main product), diphenyl oxide	203
Poly(sulfur dioxide-*co*-1-butene)	700–800	Monomers	204
Poly(sulfur dioxide-*co*-1-hexene)	700–800	Monomers	204
Poly(sulfur dioxide-*co*-1-octadecene)	700–800	Monomers	204
Poly(sulfur dioxide-*co*-bicycloheptene)	700–800	SO_2, bicycloheptene, cyclopentadiene, ethylene, methyl cyclohexadiene, benzene, indene, naphthalene, dihydronaphthalenes	204
Poly(sulfur dioxide-*co*-cyclopentene)	700–800	SO_2, cyclopentene, xylenes, ethylbenzene, styrene, indene, decadienes, dihydronaphthalenes, tetralin, napthalene	204
Poly(sulfur dioxide-*co*-*cis*-2-butene)	700–800	SO_2, butenes, benzene, toluene, octadienes, xylenes, styrene, indene, naphthalene	204
Poly(sulfur dioxide-*co*-methyl methacrylate-*co*-1-hexene) (24.2/1)	700–800	SO_2, hexenes, hexadienes, methyl methacrylate, toluene, naphthalene, dodecadienes	204
Poly(sulfur dioxide-*co*-methyl methacrylate-*co*-bicycloheptene) (2.5/1)	700–800	SO_2, ethylene cyclopentadiene, benzene, methyl methacrylate, bicyclo-heptene, methylcyclohexa-2,4-diene, ethylbenzene, xylenes, styrene, indene, naphthalene, dihydronaphthalenes	204

References page II-475

TABLE 3. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
3.6. POLY(AMIDES)			
Poly(2,5-dimethyl-1,4-piperazinediyl-isophthaloyl)	475	After 1 h, 5.1% residue, 73.8% chain fragments, 20.5% volatiles comprising mainly CO, H_2O, CH_4, CO_2, H_2, with traces of hydrocarbons, pyrazines, pyrroles	30
Poly(2,5-dimethyl-1,4-piperazinediyloxaloyl)	475	After 1 h, 1% residue, 73.5% chain fragments, comprising mainly CO, with traces of H_2, CO_2, H_2O, hydrocarbons, pyrazines, pyrroles	47
Poly(2,5-dimethyl-1,4-piperazinediyl-terephthaloyl)	475	After 1 h, 9.4% residue, 3.2% chain fragments 87.4% volatiles comprising mainly CO, H_2O, CO_2, CH_4, NH_3, with traces of hydrocarbons, pyrazines, and pyrroles	47
Poly(iminoisophthaloylimino-1,3-phenylene) (Nomex)	300–500	Mixture of H_2, CO, CO_2, H_2O, HCN, benzene, toluene, benzonitrile	57
	300–500	CO_2, H_2O, CO	205
	450–550	Benzene, HCN, toluene, benzonitrile, H_2	205
		CO, CO_2, H_2O, benzene, benzonitrile, 1,3-dicyanobenzene, 3-cyanobenzoic acid, other trace compounds	319
Poly(iminoisophthaloylimino-1,3-perchlorophenylene)	550	Water (46 mol%), CO (18), CO_2 (31), CH_4 (1.2), HCN (1.3), and smaller quantities of, N_2O, NO, CH_3Cl, ethylene, acetylene, cyanogen, acetonitrile, acetone, acetic acid, cyanogen chloride, propenenitrile, benzene, toluene, benzonitrile, phenol, chlorobenzene	206
Poly(iminoisophthalylimino-1,4-phenylene)	300–500	Mixture of H_2, CO, CO_2, H_2O, HCN, benzene, toluene, benzonitrile	57
Poly(iminoisophthaloyl-*co*-terephthaloyl-imino-1,4-phenylene)	250–620	36% residue, 24% chain fragments, 40% volatiles comprising H_2, CO, CO_2, CH_4	58
Poly(imino(1-oxohexamethylene) (Nylon 6)	327	Cyclic monomer, acetonitrile, HCN, NH_3, acrylonitrile, 3-cyanopropene, 4-cyanobutadiene, 4-cyano-1-butene, 5-cyano-1,3-pentadiene, 4-pentenal, 5-cyano-1-pentene, 3,5-hexadienal, 5-isocyanato-1-pentene, linear dimer	293
Poly(iminohexamethyleneiminoadipoyl) (Nylon 66)	310–380	H_2O, CO_2, cyclopentanone, traces of saturated and hydrocarbons; purification from water and acid polymerization catalysts increases stability and decreases yield of CO_2	45,46
	305	H_2O, CO_2, NH_3, cyclic monomer, cyclopentanone, cyclopentylidine-cyclopentanone, cyclopentylcyclopentanone, hexylamine, hexamethyleneimine, hexamethylenediamine	207
	305	CO_2, NH_3, H_2O, cyclic monomer, cyclopentanone, 2-cyclopentylidenecyclo pentanone, 2-cyclopentylcyclopentanone, hexylamine, hexamethyleneimine, hexamethylenediamine, 1,2,3,5,6,7-hexahydro dicyclopenta[b,e]pyridine	207
	400	Hexamethylenediamine, aminohexamethylene isocyanate, hexamethylenediamine-monocyclopentanimine, hexamethylenediamine-dicyclopentanimine and larger oligomers related to above; cyclopentanone	247
Poly(imino(1-oxoundecamethylene) (Nylon 11)	800	CO_2, HCN, saturated and olefinic hydrocarbons C_5–C_{11}, saturated and olefinic mononitriles $C_nH_{(2n+1)}CN$ and $C_nH_{(2n-1)}CN$, undecalactam, hydrocarbons and nitriles containing amide units	308
Poly(imino(1-oxododecamethylene) (Nylon 12)	800	CO_2, HCN, saturated and olefinic hydrocarbons C_5–C_{11}, saturated and olefinic mononitriles $C_nH_{(2n+1)}CN$ and $C_nH_{(2n-1)}CN$, dodecalactam, hydrocarbons and nitriles containing amide units	308
Poly(iminoterephthaloylimino-1,3-phenylene)	300–500	Mixture of H_2, CO, CO_2, H_2O, HCN, benzene, toluene, benzonitrile	57
Poly(iminoterephthaloylimino-1,4-phenylene) (Kevlar)	300–500	Mixture of H_2, CO, CO_2, H_2O, HCN, benzene, toluene, benzonitrile	57
	370–450	CO_2, H_2O, CO	205
	450–550	Benzene, HCN, toluene, benzonitrile, H_2	
	527	Cyanobenzene, dicyanobenzene, aniline, 1,4-diaminobenzene, 4-cyanoaniline, benzaldehyde, benzene, CO, NH_3, CO_2, H_2O, benzamide, benzoic acid, phenylisocyanate, terephthaldehyde, benzanilide, NH_2–Ph–NH–CO–Ph, NC–Ph–NH–CO–Ph, NH_2–Ph–NH–CO–Ph–CN, Ph–NH–CO–Ph–CHO	293
Poly(2-methylpiperazinediylterephthaloyl)	475	After 1 h, 11.3% residue, 46.2% chain fragments, 42.5% volatiles comprising mainly CO, H_2O, CO_2, CH_4, NH_3, H_2, with traces of hydrocarbons, pyrazines, and pyrroles	30
Poly(1,4-piperazinediylterephthaloyl)	475	After 1 h, 21.1% residue, 45.6% chain fragments, 33.3% volatiles comprising mainly H_2O, CO, H_2, CO_2, NH_3, with traces of hydrocarbons, pyrazines, and pyrroles	30

TABLE 3. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
3.7. POLY(SILOXANES)			
Poly(oxy-dimethylsilylene) (Poly(dimethyl siloxane))	Ambient to 500	Predominantly cyclic trimer with smaller amounts of cyclic tetramer and higher cyclics; threshold degradation temperature of about 300°C reduced to 100°C by 5% KOH and CH_4 formed as additional product	208
	470	Distribution of cyclic oligomers, $n = 3$ (243.9 relative mass spec. intensity), $n = 4$ (100), $n = 5$ (35.6), $n = 6$ (37.6), $n = 7$ (13.1), $n = 8$ (1.1), $n = 9$ (0.2)	317
Poly(oxy-methylphenylsilylene)	Ambient to 500	Mixture of all possible stereoisomeric cyclic trimers and tetramers with small amounts of pentamer, benzene, and two more complex oligomers	209
Poly(oxy-methyl-3,3,3-trifluoro-propylsilylene)	400	Low-molecular-weight cyclic oligomers, $CF_2{=}CH{-}CH_3$, CHF_3	70
	615 for 30 s	Cyclic methyl-(3,3,3-trifluoropropyl)siloxanes, CH_4, CHF_3, $CF_2{=}CH{-}CH_3$, $CH_2{=}CH{-}CF_3$	210
Poly(oxy-phenylbutoxysilylene)	430–500	CO, H_2 and hydrocarbons	211
Poly(dimethyl siloxane-*co*-diphenyl siloxane)	Ambient to 500	Complex mixture of cyclic oligomers, which have been individually identified, whose composition varies with the dimethyl/diphenyl ratio; small amounts of benzene	212
Poly(dimethyl siloxane-*co*-phenylmethyl siloxane)	Ambient to 500	Complex mixture of cyclic oligomers, which have been individually identified, whose composition varies with the dimethyl/methyl phenyl ratio; small amounts of benzene	213
Poly(dimethyl-1,4-silphenylene)	400 in argon	Methane, dimethylsilane, benzene, dimethylphenylsilane,  dimethyldiphenylsilane, 	214
Poly(oxy-methylphenyl-1,4-silphenylene-silylene)	Ambient to 500	Benzene, diphenylmethylsilane, triphenylmethylsilane, and higher linear oligomers	215
Poly(oxy-tetramethyl-1,4-silphenylene-silylene)	500 in argon	Methane, $H{-}Si(CH_3)_2{-}O{-}Si(CH_3)_2{-}H$, benzene, cyclic trimer of dimethylsiloxane, and various higher chain fragments (see Ref.)	214
	Ambient to 500	Cyclic trimer and tetramer of dimethylsiloxane and a complex mixture of higher linear and cyclic oligomers	216
Poly(oxy-tetramethyl-1,3-silphenylene-silylene-hexafluoropropylenephenylene)	615 for 30 s	HF (15–18%), methane, methyltrifluorosilane, dimethyldifluorosilane, benzene, toluene, phenyldifluoromethane	210
Poly(oxy-tetramethyl-1,3-silphenylene-silylene-tetrafluoroethylenephenylene)	615 for 30 s	HF (15–18%), methane, methyltrifluorosilane, dimethyldifluorosilane, benzene, toluene, phenyldifluoromethane	210
Poly(oxy-tetramethyl-1,3-silphenylene-siloxane-*co*-dimethylsiloxane)	Ambient to 500	Cyclic trimer and tetramer of dimethylsiloxane and a complex mixture of higher linear and cyclic oligomers	216
Poly(boron tri(dimethylsiloxane)), nonlinear	250–350	Molecular weight increases; traces of cyclic products $[(CH_3)_2SiO]_3$ and $[(CH_3)_2SiO]_4$	15
3.8. POLY(URETHANES)			
Poly(oxy-2,2-dimethyltrimethylene) oxycarbonyl-*N*-imino-1,4-phenylenemethylene-1,4-phenylene-*N*-iminocarbonyl)	350	Various fragments of the main chain (see Ref.)	231
Poly(oxy-1,4-phenyleneisopropylidene-1,4-phenyleneoxycarbonylimino-1,4-phenylene methylene-1,4-phenylene-iminocarbonyl)	190	4,4′-Diphenylmethane diisocyanate, bisphenol A	231
Poly(oxy-1,4-phenyleneisopropylidene-1,4-phenylene-oxycarbonyl-*N*-methylimino-1,4-phenylenemethylene-1,4-phenylene-*N*-methyliminocarbonyl)		Bisphenol A, 4,4′-*N*-methyldiphenyl methane and linear and cyclic fragments of the main chain (see Ref.)	231
Poly(oxy-1,4-phenyleneisopropylidene-1,4-phenylene-oxycarbonyl-*N*-methyliminohexa-methylene-*N*-methyliminocarbonyl)	330	Cyclic monomer and dimer, and various chain fragments	232
Poly((oxy-1,4-phenyleneisopropylidene-1,4-phenylene-oxycarbonyl-piperazine-1,4-diyl-carbonyl)	330	Cyclic dimer, bisphenol A and various chain fragments	232

References page II-475

TABLE 3. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(oxy-1,3-phenylene-oxycarbonyl-*N*-methylimino-hexamethylene-*N*-methyliminocarbonyl)	320	Cyclic monomer, dimer and trimer, resorcinol	232
Poly(oxy-1,4-phenyleneoxycarbonyl-*N*-methylimino-1,4-phenylenemethylene-1,4-phenylene-*N*-methyliminocarbonyl)	325	Cyclic dimer, 4,4′-*N*-methyldiphenylmethane, hydroquinone, and higher chain fragments (see Ref.)	232
Poly(oxy-1,3-phenylene-oxycarbonyl-piperazine-1,4-diyl-carbonyl)	360	Cyclic dimer and trimer, resorcinol, and various chain fragments (see Ref.)	232
Poly(oxytetramethylene oxycarbonyl-imino-1,4-phenylenemethylene-1,4-phenylene-iminocarbonyl)	Ambient to 500	1,4-Butanediol, methylene bis-(4-phenyl isocyanate), tetrahydrofuran, CO_2, H_2O, butadiene, HCN, CO	228
with 10% (w/w) ammonium polyphosphate	Ambient to 500	Methylene bis-(4-phenyl isocyanate), tetrahydrofuran, H_2O, aniline, formaldehyde, CO_2	229
Poly(oxy-xylylene-oxycarbonylimino-xylylene-iminocarbonyl)	300	CO_2, *trans*-1,4-cyclohexane-dimethanol, 4-methylene-cyclohexane-methanol, xylylene diamine	230
Polyurethane from methylene bis-(4-phenyl isocyanate) (105 parts) and propoxylated trimethyl propane (100 parts)	600	Methane, CO_2, ethylene ethane, H_2O, propene, propane, ethanol, isobutene, acrolein, propanal, 2-methyl-1-butene, 2-methylpropenal, 2-butanone, benzene, dihydropyran, 2,2,4-trimethyl-1,3-dioxalane	234
	250–350	CO_2, propene, some methane and propanal	256
	350–500	Methane, ethane, ethene, propane, propene, ethanal, propanal, diminishing quantities of CO_2	256
	500–650	Methane (max. rate of production at 600°C), ethane, ethene, propene, ethanal, propanal	256
	650–800	Methane, ethane, ethene, propene, ethanal, propanal	256
Polyurethane from butane diol, phenylphosphonic dichloride, and methylene bis-(4-phenyl isocyanate)	Ambient to 500	CO_2 tetrahydrofuran, dihydrofuran, aniline, *p*-toluidine, *N*-phenyl pyrrolidine, *N*-(*p*-tolyl) pyrrolidine, cyclobutylene phenylphosphonate, butane diol, methylene bis-(4-phenyl isocyanate), 4,4′-methylene dianiline	235
Polyester urethane from an ethylene/propylene glycol/adipic acid polyester, butane diol and methyl bis-(4-phenyl isocyanate)	Ambient to 500	Modified chain fragments, ethylene, propylene, CO_2, ethylene oxide, propylene oxide, acetaldehyde, tetrahydrofuran, water, cyclopentanone, ethylene, glycol, propylene glycol, adipic anhydride (trace), aniline (trace)	236
Poly(urethane-*co*-carbonates)	330	Cyclic monomer, bisphenol A and higher linear and cyclic fragments of the chain (see Ref.)	237
	290	Cyclic monomer, resorcinol, and various fragments of the chain (see Ref.)	237

3.9. OTHER NITROGEN CONTAINING POLYMERS

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(*t*-butyl aziridine)	Ambient to 500	Ethene, propane, propene, isobutane, isobutene, ethylamine, aziridine, 1-*t*-butyl-perhydro-1,4-diazine, *N*-*t*-butyl ethylamine, 1-*t*-butyl-4-isopropenyl-1,2,3,4-tetrahydro-1,4-diazine, 1,4-di-(*t*-butyl)-perhydro-1,4-diazine, oligomers	276

3.10. PHOSPHOROUS CONTAINING POLYMERS

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(oxytetramethylene oxyphenyl phosphono)	Ambient to 550	Butadiene, tetrahydrofuran, dihydrofuran, H_2O, cyclic ester of phenylphosphonic acid and 1,4-butanediol, phenylphosphonic acid, butane diol	233
Poly(oxytetramethylene oxyphenyl-phosphono) capped with phenylisocyanate) 	Ambient to 500	Butadiene, tetrahydrofuran, dihydrofuran, H_2O, cyclic ester of phenylphosphonic acid and butanediol, phenylphosphonic acid, butane diol, CO_2, aniline	233
Poly(bis(trifluoroethoxy)phosphazene)	150–400	Cyclic trimer, tetramer, pentamer, hexamer, and higher oligomers, 1,1,1-trifluoro-2-chloroethane (due to residual chlorine in the polymer)	238
Poly(diphenoxyphosphazene)	100–400	Cyclic tetramer, trimer and higher oligomers, chlorobenzene (due to residual chlorine in the polymer), phenol, triphenylphosphate	239

TABLE 3. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(diphenoxy-phosphazene) (residual chlorine content: <0.05%)	Ambient to 480	Traces of phenol, phenoxy cyclic trimer and monochlorophenoxy cyclic trimer	316
Poly(diphenoxy-phosphazene) (residual chlorine content: 2.4%)	Ambient to 480	Phenoxy cyclic trimer and tetramer, monochloropentaphenoxy cyclic trimer, monochloroheptaphenoxy cyclic tetramer, dichlorohexaphenoxy cyclic tetramers	316
Poly(diphenoxy-phosphazene) (residual chlorine content: 9.9%)	Ambient to 480	Phenoxy cyclic trimer and tetramer, monochloropentaphenoxy cyclic trimer, monochloroheptaphenoxy cyclic tetramer, dichlorohexaphenoxy cyclic tetramers, dichlorotetraphenoxy cyclic trimers, trichloropentaphenoxy cyclic tetramers, HCl	316

TABLE 4. MAIN-CHAIN HETEROCYCLIC POLYMERS

Polymer	Temperature range (°C)	Degradation products	Refs.
Phenol-formaldehyde resin	250–400	Volatiles comprise xylene (76%), traces of phenol, cresol, benzene	53
Poly(1-methylene-2-imidazolidinone)	240	Formaldehyde (trace)	253
(Poly(ethyleneurea formaldehyde))	Ambient to 600	Low boiling fraction consists of NH_3, CO_2, HCN, CH_4, CO (trace); IR data also suggests presence of isocyanate, ketamine and carbodiimide or cyanogen compounds; high boiling fraction (77% of total volatiles) consists of chain fragments up to pentamer, including *N*-methylethylene urea, corresponding unsaturated compounds and higher homologues; similarly, *N,N'*-dimethylethylene urea and homologues	253
Poly(*N*-phenylmaleimide)	100–400	Aniline, Ph–N=CH–CH_2–CH_3, *N*-phenylsuccinimide, *N*-phenylmaleimide (trace), Ph–N=CH–CH=CH–CO–NH–Ph	301
Poly(5,5'-bibenzimidazole-2,2'-diyl-1,4-phenylene)	400–700	Phenol, terephthalodinitrile, benzonitrile, 4,4'-diaminodiphenyl, H_2, CO, NH_3, HCN, traces of aniline, carbonaceous residue	56
	570, 700, 1000	H_2 (700 and 1000°C), NH_3 (570 and 700), N_2O, HCN, cyanogen (570 only), CH_4, C_2H_6, ethylene, acetylene (700 and 1000), acetonitrile (700 and 1000), propene (570 and 700), benzene, toluene, benzonitrile (700 only), ethylbenzene, methylbenzonitrile (700 only)	217
Poly(5,5'-bibenzimidazole-2,2'-diyl-1,3-phenylene)	599–667	Gaseous products; H_2, NH_3, HCN, and CH_4; products involatile at ambient temperature after approx. 50% weight loss; benzimidazole (29.8%), benzoxazole (4.9%), 2-methylbenzimidazole (7.3%), 2-phenyl-benzimidazole (24.3%), 2-(3-methylphenyl)benzimidazole (5.3%), 5-(3-aminophenyl)benzimidazole (9.6%), 2-(3-cyanophenyl)benzimidazole (7.8%), 5,5'-bibenzimidazole (4.4%), 2-phenyl-5-(3-aminophenyl)-benzimidazole (4.4%), 2-phenyl-5,5'-bibenzimidazole (1.9%), 2-phenyl-5-(benzoxazolo)-benzimidazole (0.3%)	218
Poly(1,3,5,7-tetraoxo-2,3,6,7-tetra-hydro-(1H,5H)-2,6-benzo[1,2-c : 4,5-c']-dipyrroldiyl-1,4-phenylene-carbonyl-1,4-phenylene) (Poly(pyromellitimide))	700	H_2, CO, CH_4, CO_2, H_2O, benzene, benzonitrile, chain fragments, 60% residue	61
Poly(1,3,5,7-tetraoxo-2,3,6,7-tetra-hydro-(1H,5H)-2,6-benzo[1,2-c : 4,5-c']-dipyrroldiyl-1,4-phenylene-methylene-1,4-phenylene) (Poly(pyromellitimide))	700	H_2, CO, CH_4, CO_2, H_2O, benzene, toluene, benzonitrile, chain fragments, 60% residue	61
Poly(1,3,5,7-tetraoxo-2,3,6,7-tetra-hydro-(1H,5H)-2,6-benzo[1,2-c : 4,5-c']-dipyrroldiyl-1,4-phenylene-oxy-1,4-phenylene) (Poly(pyromellitimide))	700	H_2, CO, CH_4, CO_2, H_2O, benzene, benzonitrile, phenol, chain fragments, 60% residue	61
Poly(1,5-diimino-3,7-dioxo-2,3,6,7-tetrahydro-(1H,5H)-2,6-benzo [1,2-c : 4,5-c']dipyrroldiyl-1,3-phenylene)	450–500	CO, CO_2, HCN, NH_3, H_2 and traces of CH_4 and C_6H_6; NH_3 is the main product at 440°C, CO increases at higher temperatures	219
Poly(1,5-diimino-3,7-dioxo-2,3,6,7-tetrahydro-(1H,5H)-2,6-benzo [1,2-c : 4,5-c']dipyrroldiyl-1,4-phenyleneoxy-1,4-phenylene)	450–500	CO, CO_2 HCN, NH_3, H_2 and traces of CH_4 and C_6H_6; NH_3 is the main product at 440°C, CO increases at higher temperatures	

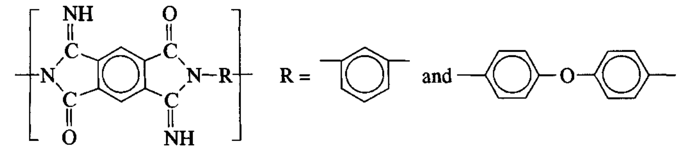

TABLE 4. *cont'd*

Polymer	Temperature range (°C)	Degradation products	Refs.
Poly(triazines)			
	415–505	C_2F_4, C_2F_6, and smaller amounts of C_3H_6 and C_3H_8 and larger chain fragments	48
	430–503	C_2F_4 with traces of CF_4, C_3H_6, and larger chain fragments	48
	305–465	Only volatile product is benzonitrile	54
	480–660	HCN and NH_3	54
	690–760	H_2 and carbonaceous residue	54
	424–550	Perfluoroethane, perfluoromethane, perfluoroethylene, perfluoropropane, perfluoropropylene, acetal fluoride, carbonyl fluoride	220
Poly(perfluoropyridine)	600	Volatiles comprise CO_2, CO, SiF_4 (all from silica vessel); carbonaceous residue remains	52
Poly(parabanic acid)			
	300	CO_2, CO, NO	221
Poly(bismaleimides)			
 R = $-(CH_2)_2-$, $-(CH_2)_6-$, $-(CH_2)_8-$, $-(CH_2)_{10}-$, $-(CH_2)_{12}-$, 	350–500	Aliphatic: C_2–C_6 fractions, maleimide (MI), succinimide (SI) MI–CH_3, SI–CH_3, MI–C_2H_5, SI–C_2H_5, MI–C_3H_7, SI–C_3H_7, MI–C_4H_9, SI–C_4H_9, MI–C_5H_{11}, SI–C_5H_{11}, MI–$(CH_2)_2$–MI, SI–$(CH_2)_2$–SI, MI–$(CH_2)_6$–MI, MI–$(CH_2)_8$–MI, MI–$(CH_2)_{10}$–MI, MI–$(CH_2)_{12}$–MI	222
R = 	350–500	Benzene, toluene, aniline, SI, methylaniline, phenylisocyanate, tolylisocyanate, and various other products (see Ref.)	222
R = 	350–500	Aniline, phenol, SI, anisidine, phenylisocyanate, and various other products (see Ref.)	222
Poly(3-(4-octylphenyl)-2,2′-bithiophene)	800	H_2S, COS, SO_2, CH_3SH, CS_2, S_8, C_1–C_8 alkanes and alkenes, benzene, ethylbenzene, toluene, styrene, octylbenzene, thiophene, methylthiophene, bithiophene	284
Poly(3-octylthiophene)	550–1400	C_1–C_8 alkanes and alkenes, H_2S, CS_2, benzene, toluene	284
Poly(3-octyl-2,2′-bithiophene)	550–1400	C_1–C_8 alkanes and alkenes, H_2S, CS_2, benzene, toluene	284
Poly(3-(4-octylphenyl)thiophene)	550–1400	C_1–C_8 alkanes and alkenes, H_2S, CS_2, benzene, toluene	284

TABLE 5. CELLULOSE AND ITS DERIVATIVES

Polymer	Temperature range (°C)	Degradation products	Refs.
Cellulose	250–397	H_2O with smaller amounts of CO_2 and CO and a tar containing principally levoglucosan	17,18
	Ambient to 500	H_2, CO, CO_2, H_2O, furan, furancarboxyaldehyde, methylfurans, acetone, hydroxypropanone, butenal, butanone, butanedione, levoglucosan	273
–, α form	330–440	Fixed gases (not identified), pentene, acetaldehyde, furan, propionaldehyde, acetone, acrolein, 2-methylfuran, butyraldehyde, methyl ethyl ketone, benzene, 2,5-dimethylfuran, methyl vinyl ketone, 2,3-butanedione, toluene, crotonaldehyde, H_2O, cyclopentanone, cyclooctatetraene, acetol, pyruvaldehyde, acetic acid, furfural, formic acid, 5-methyl-2-furfural, furfuryl alcohol, butyrolactone, 2-hydroxy-3-methyl-3-cyclopenten-2-one, phenol, *o*-cresol, *m*-cresol, *p*-cresol, 2,5-dimethylphenol, 3,4-dimethylphenol, 5-hydroxymethylfurfural	162
Cellulose (oxidized)	180–331	Mainly H_2O and CO_2, smaller amounts of CO, formaldehyde, methanol, acetic acid, ethanol and acetaldehyde, and very little tar	
Cellulose triacetate	250–310	Product fraction volatile at 25°C contains acetic acid, CO_2, CO, CH_4, H_2, acetaldehyde and acetone; heavier fractions do not contain levoglucosan acetate	18
	250–900	Main products: acetic acid, water, CO, CH_4, H_2, CO_2; minor products: ketene, acetaldehyde, acetone, acetylene, ethylene, ethane, propylene, and C_4, C_5 and C_6 hydrocarbons	223
	230–320	Acetic acid, acetyl derivatives of D-glucose	224
Ethyl cellulose	306	H_2O, CO, CO_2, C_2H_4, C_2H_6, C_2H_5OH, CH_3CHO, aliphatic compounds, furan derivatives	224

A. INTRODUCTION

The *G* values quoted in the following tables are defined as the radiation chemical yields of individual atomic or molecular events for 100 eV of energy absorbed by the system. *G*(R) represents the yield of free radicals, *G*(X) the yield of crosslinks, *G*(S) the yield of main chain scission, and *G*(products) the yield of product molecules per 100 eV of absorbed radiation.

This table has been compiled from the polymer literature that has been published since the third edition of the "Polymer Handbook" (i.e. 1986–1997). In many cases, the tabulated data are only representative of the total data in the paper, and the original publication should be consulted.

B. TABLES OF *G* VALUES

Notes to the Tables

General: Unless otherwise stated, the conditions applying are γ-rays, vacuum, room temperature (ambient).

Symbols/Abbreviations

+	cation radical	d.b.	double bond
−	anion radical	*t*-v	*trans*-vinylene
vac	vacuum	Y	crosslinks
RT	room temperature	X	crosslinks
e	electron beam	n	neutron

TABLE 1. HOMOPOLYMERS

Polymer	*G*(R)	*G*(X)	*G*(S)	*G*(products)	Radiation conditions	Comments	Refs.

TABLE 2. *cont'd*

Copolymer	*G*(R)	*G*(X)	*G*(S)	*G*(products)	Radiation conditions	Comments	Refs.
Poly(ethylene-*co*-sulfur dioxide)				Various gases	273–423 K		124
Poly(hexene-1-*co*-sulfur dioxide)				Various gases	273–423 K		31,124
Poly(isobutene-*co*-sulfur dioxide)				Various gases	273–423 K		31,124
Poly(3-methyl-1-butene-*co*-sulfur dioxide)	1.8			Various gases	273–423 K		Poly(31,124, 150
Poly(propylene-*co*-sulfur dioxide)	2.2			Various gases	273–423 K		31, 124, 150
2.5. OTHER COPOLYMERS							
Poly(butyl methacrylate-*co*-1-naphthyl methacrylate)			0.14			Benzene soln.	1
Poly(glutamic acid-*co*-tyrosine)		0.03–0.5	0–0.5		300 K	Various compositions	214
Poly(glycolic acid-*co*-1-lactic acid)	2.23–2.36 1.49–1.53				77 K 300 K	Various compositions	203
Poly(glycidyl methacrylate-*co*-3-chlorostyrene)	1.0	0.42					144
Poly(hydroxy butyrate-*co*-valerate)	Various				77, 263, 273, 303 K	Different compositions	217
		3.0–0.5	2.7–3.4	Various gases 1,4-ester	e, gamma		218
Poly(methacrylonitrile-*co*-methyl-2-chloroacrylate)			3.2–43.*			*G(S)− G(X)	17
Poly(*N*-vinylpyrrolidone-*co*-*t*-butyl-*s*-vinyl thiocarbonate)	3.01				77 K	+ Warming	13
Poly(acrylonitrile-*co*-butadiene)		20/150			Air		104
Poly(acrylonitrile-*co*-chloroprene)				3.5 (Gas)			119
Poly(tetrafluoroethylene-*co*-hexafluoropropylene)		3.3					106
Poly(tetrafluoroethylene-*co*-propylene)		1.3	0.42			Emulsion polymer + H_2O	121
				0.6–5.2 (HF)	N_2		116
		1.16			240 C		266
Poly(vinyl chloride-*co*-ethylglycodi-methacrylate)				30 (d.b.)			8
Poly(vinylidene chloride-*co*-dimethyl itaconate)			2.3–2.7			*G(S)− G(X)	17
Poly(vinylidene chloride-*co*-hexafluoro-propylene)		1.2			Vac/air/H_2O	+ Additives	166
Tetrafluoroethylene, perfluoro methyl vinyl ether copolymer 2:1				0.93 (CF_4) 0.31 (COF_2) 0.055 (CO_2) 0.14 (CF_3 OCF_3) 1.43 (total gas) 0.34 (acid fluoride)	e		229
		0.9		New chain ends 1 ($-CF_2-CF_3$) 0.09 ($-CF_2-O-CF_3$) 0.5 (CF_2-COOH) 0.2($-CF=CF_2$)			268
Polysulphone–polydimethyl siloxane *block* copolymer	Various					Dose and molecular weight effects	272

A. INTRODUCTION

This chapter contains some of the principal properties of the more common monomers. The monomers are arranged alphabetically, in groups, with derivatives listed alphabetically within the groups. Compounds are listed under their most commonly used names in polymer chemistry. Therefore, some names are not in agreement with the nomenclature rules of the International Union of Pure and Applied Chemistry.

Data are taken from a variety of published literature, including the 3rd edition of the "Polymer Handbook", "The Brandon Worldwide Monomer Reference Guide and Sourcebook", the "Aldrich Catalog Handbook of Fine Chemicals", and "Polysciences Monomers/Polymers, Scientific Polymer Products", "TCI America", "Lancaster and Janssen Chemica" catalogs. Where a range is reported in the literature, the average value is used here for melting points and boiling points. No attempt was made to verify the reported values experimentally.

Linear structures are given for most monomers. Molecular formulas are provided when linear structures cannot be unambiguously drawn.

Molecular weight is calculated based on the International Atomic Weight values.
Boiling point is given in degrees Celsius (°C), at 760 mmHg, unless indicated otherwise by the value in mmHg following a slash (/).
Melting point is given in degrees Celsius (°C), at 760 mmHg, unless indicated otherwise by the value in mmHg following a slash (/).
Refractive index is given at 20°C, unless indicated otherwise by the temperature in Celsius following a slash (/).
Density is relative to water at 4°C and measured at 20°C, unless otherwise indicated by the value following a slash (/).
Flash point was determined by the closed-cup method, using a Setaflash apparatus.

RTECS# is the reference to the Registry of Toxic Effects of Chemical Substances.

R&S is the reference found in the "Sigma–Aldrich Library of Regulatory & Safety Data", available from Aldrich Chemical Company.

FT-NMR is the reference to spectra in the "Aldrich Library of ^{13}C and ^{1}H FT-NMR Spectra", available from the Aldrich Chemical Company.

FT-IR is the reference to spectra in the "Aldrich Library of FT-IR Spectra", available from the Aldrich Chemical Company.

Merck Index is the reference to "The Merck Index", Merck & Co., Inc., Whitehouse Station, NJ.

Beilstein is the reference to "Beilsteins Handbuch der Organischen Chemie", Springer–Verlag, New York, NY.

Fieser is the reference to L. F. Fieser and M. Fieser, "Reagents for Organic Synthesis", John Wiley, New York, NY.

Abbreviations: (d) decomposes; (s) sublimes; (aq) aqueous.

B. TABLES OF PHYSICAL PROPERTIES

TABLE 1. ACETYLENES

Name	Formula $RC \equiv CR'$ R	R'	CAS Registry Number	Mol. wt.	Boiling point (°C)	Melting point (°C)
Acetylene	–H	–H	74-86-2	26.04	– 82	– 84(s)
–, Chloro	–Cl	–H		60.48	– 32	– 126
–, Dichloro-	–Cl	–Cl		94.93		– 66
–, Diphenyl-	$-C_6H_5$	$-C_6H_5$	501-65-5	178.23	60	170/19
–, Phenyl-	$-C_6H_5$	–H		102.14	143	

TABLE 2. ACID DICHLORIDES

Name	Formula ClC(O)RC(O)Cl R	CAS Registry Number	Mol. wt.	Boiling point (°C)	Melting point (°C)
Adipoyl	$-(CH_2)_4-$	111-50-2	183.03	106/2

Butane-	$-(CH_2)_4-$	110-60-1	88.15	159	27
Decane-	$-(CH_2)_{10}-$	646-25-3	172.32	140/12	62
Dodecane-	$-(CH_2)_{12}-$	2783-17-7	200.37		70
Ethylene-	$-(CH_2)_2-$	107-15-3	60.10	118	8.5
Heptane-	$-(CH_2)_7-$	646-19-5	130.24	224	28
Hexane-	$-(CH_2)_6-$	124-09-4	116.21	204	43
Nonane-	$-(CH_2)_9-$	646-24-2	158.29	258/756	37
Octane-	$-(CH_2)_8-$	373-44-4	144.26	225	51
Pentane-	$-(CH_2)_5-$	462-94-2	102.18	179	
1,2-Phenylene-	$-C_6H_4-$	95-54-5	108.14	257	104
1,3-Phenylene-	$-C_6H_4-$	108-45-2	108.14	283	65
1,4-Phenylene-	$-C_6H_4-$	106-50-3	108.14	267	144
Propane-	$-(CH_2)_3-$	109-76-2	74.13	140	− 12

TABLE 9. ANHYDRIDES

Name	Formula	CAS Registry Number	Mol. wt.	Boiling point (°C)	Melting point (°C)
9.1. MONOANHYDRIDES					
Acetoxysuccinic	$C_6H_6O_5$	79814-40-7	158.11		56
S-Acetylmercaptosuccinic	$C_6H_6O_4S$	6953-60-2	174.18		83
Aconitic, *cis*-	$C_6H_4O_5$	6318-55-4	156.10		75
Acrylic (see Acrylates)					
Allylsuccinic	$C_7H_8O_3$	7539-12-0	140.1	260	6
4-Amino-1,8-naphthalic	$C_{12}H_7NO_3$	6492-86-0	213.20		
1,2,4-Benzenetricarboxylic (trimellitic)	$C_9H_4O_5$	552-30-7	192.13		167
Bicyclo[2.2.2.]oct-5-ene-2,3-dicarboxylic, *endo*-	$C_{10}H_{10}O_3$	24327-08-0	178.19		145
Bromomaleic	C_4HBrO_3	5926-51-2	176.96	215	
4-Bromo,1,8-naphthalic	$C_{12}H_5BrO_3$	21563-29-1	277.08		218
3-(*tert*-Butyldimethylsilyloxy)-glutaric	$C_{11}H_{20}O_4Si$	91424-40-7	244.37		80
4-*tert*-Butylphthalic	$C_{12}H_{12}O_3$	32703-79-0	204.23		73
N-Carboxybenzyloxy-L-aspartic	$C_{12}H_{11}NO_5$	4515-23-5	249.23		123
Cantharidin	$C_{10}H_{12}O_4$	56-25-7	196.20		216
5-Chloroisotoic	$C_8H_4ClNO_3$	4743-17-3	197.58		300(d)
4-Chloro-1,8-naphthalic	$C_{12}H_5ClO_3$	4053-08-1	232.63		208
Citraconic	$C_5H_4O_3$	616-02-4	112.08	213	7
Cyclohexane-1,2-dicarboxylic, *cis*-	$C_8H_{10}O_3$	13149-00-3	154.17	158/17	33

Isorefractive and Isopycnic Solvent Pairs

Hans-G. Elias
Michigan Molecular Institute, 1910 West St. Andrews Rd., Midland, MI 48640, USA

A. INTRODUCTION

Isorefractive solvents are solvents having the same refractive index, and isopycnic solvents are those that have the same density.

The determination of molar masses by non-colligative methods such as light scattering and ultracentrifugation will lead only to *apparent* molar masses if solvent mixtures are used whose components are not isorefractive. The observed increases or decreases of these apparent molar masses depend in sign and magnitude on both the preferential solvation and the refractive index increment of solvent 2 in solvent 1 at a fixed polymer concentration. The effect disappears if isorefractive solvent pairs are used.

A similar effect may be observed in ultracentrifugal experiments with non-isopycnic solvent pairs. To suppress these effects, isopycnic-isorefractive solvent pairs should be used. A table of isorefractive and isopycnic solvent pairs was prepared (for 25°C), starting with 392 commonly used solvents. A solvent pair was classified as isorefractive and isopycnic if the components had differences no greater than ±0.002 in refractive index and ±0.015 g/ml in density. The miscibility of the components was not checked.

B. TABLE OF ISOREFRACTIVE AND ISOPYCNIC SOLVENT PAIRS

		Refractive index		Density (g/ml)	
Solvent 1	**Solvent 2**	**1**	**2**	**1**	**2**
Acetone	Ethanol	1.357	1.359	0.788	0.786

Refractive Indices of Common Solvents

Hans-G. Elias
Michigan Molecular Institute, 1910 West St. Andrews Rd., Midland, MI 48640, USA

A. INTRODUCTION

Measurements which depend on the difference in refractive index between the polymer and the solvent will, in general, give greater accuracy as the refractive index increment between polymer and solvent is increased. The magnitude of the increment may be either positive or negative. Systems involving refractive index increments are those of light scattering and ultracentrifugation when either schlieren or interference optics is used. A table of commonly used solvents, arranged according to increasing refractive index, will be useful in practical work with many different polymers. Data at 25°C, D-line.

B. TABLE OF REFRACTIVE INDICES OF COMMON SOLVENTS

Solvents	Refractive index
Trifluoroacetic acid	1.283
Trifluoroethanol	1.290
Octafluoro-1-pentanol	1.316
Dodecafluoro-1-heptanol	1.316
Methanol	1.326
Acetonitrile	1.342
Ethyl ether	1.352
Acetone	1.357
Ethyl formate	1.358
Ethanol	1.359
Methyl acetate	1.360
Propionitrile	1.363
2,2-Dimethylbutane	1.366
Isopropyl ether	1.367
2-Methylpentane	1.369
Formic acid	1.369
Ethyl acetate	1.370
Acetic acid	1.370
Propionaldehyde	1.371
n-Hexane	1.372
2,3-Dimethylbutane	1.372
3-Methylpentane	1.374
2-Propanol	1.375
Isopropyl acetate	1.375
Propyl formate	1.375
2-Chloropropane	1.376
2-Butanone	1.377
Butyraldehyde	1.378
2,4-Dimethylpentane	1.379
Propyl ether	1.379
Acetaldehyde diethyl acetal	1.379
Butyl ethyl ether	1.380
Nitromethane	1.380
Trifluoropropanol	1.381
2-Methylhexane	1.382
Butyronitrile	1.382
Propyl acetate	1.382
Ethyl propionate	1.382
2-Methyl-2-propanol	1.383
Propanol	1.383
Isobutyl formate	1.383
Diethyl carbonate	1.383
Heptane	1.385
t-Butanol	1.385
Propionic acid	1.385
3-Methylhexane	1.386
Propylamine	1.386
3-Methyl-2-butanone	1.386
1-Chloropropane	1.386
2,2,3-Trimethylbutane	1.387
s-Butyl acetate	1.387
Butyl formate	1.387
Isobutyl acetate	1.388
2,2,4-Trimethylpentane	1.389
2,3-Dimethylpentane	1.389
Acetic anhydride	1.389
Diisopropylamine	1.390
2-Butylamine	1.390
2-Pentanone	1.390
3-Pentanone	1.390
Nitroethane	1.390
Methyl *n*-butyrate	1.391
Butyl acetate	1.392
2-Nitropropane	1.392
4-Methyl-2-propanone	1.394
2-Methyl-1-propanol	1.394
Octane	1.395

Solvents	Refractive index
Isobutylamine	1.395
Valeronitrile	1.395
2-Butanol	1.395
2-Hexanone	1.395
2-Chlorobutane	1.395
Butyric acid	1.396
2,2,5-Trimethylhexane	1.397
Dibutyl ether	1.397
Butanol	1.397
Acrolein	1.397
1-Chloro-2-methylpropane	1.397
Methacrylonitrile	1.398
3-Methyl-2-pentanone	1.398
Triethylamine	1.399
Butylamine	1.399
2,4-Dimethyl-3-pentanone	1.399
Isobutyl *n*-butyrate	1.399
1-Nitropropane	1.399
Dodecane	1.400
Amyl acetate	1.400
1-Chlorobutane	1.400
2-Methoxyethanol	1.400
Propionic anhydride	1.400
2,2,3-Trimethylpentane	1.401
1-Chlorobutane	1.401
β-Methoxypropionitrile	1.401
Isovaleric acid	1.402
Nonane	1.403
Dipropylamine	1.403
Isoamyl acetate	1.403
Cyclopentane	1.404
2-Methyl-2-butanol	1.404
3-Methyl-1-butanol	1.404
Tetrahydrofuran	1.404
Capronitrile	1.405
4-Heptanone	1.405
2-Ethoxyethanol	1.405
2-Heptanone	1.406
Valeric acid	1.406
Diisobutylene	1.407
Methylcyclopentane	1.407
Isoamyl ether	1.405
2-Pentanol	1.407
Tributyl borate	1.407
Pentanol	1.408
3-Methyl-2-butanol	1.408
Diethyl oxalate	1.408
Decane	1.409
4-Methyl-2-pentanol	1.409
3-Isopropyl-2-pentanone	1.409

2,4-Bis(α-phenylethyl)phenylmethyl ether	1.590
Carbon disulfide	1.628
1,1,2,2-Tetrabromoethane	1.633
Methylene iodide	1.749

Physical Constants of the Most Common Solvents for Polymers

Daniel R. Bloch
Lakeshore Research, Racine, WI, USA

Values given here have been taken a variety of reference books. Where a range was given, the melting and boiling points given here are average values. Flash point was determined by the closed cup method, using a Setaflash apparatus. The refractive index is reported relative to the sodium D line. Boiling points are given at 760 mmHg unless indicated otherwise by the pressure in mmHg following a slash (/). Viscosity is reported at 20°C unless indicated at another temperature in Celsius following a slash (/).

Compound	CAS Number	Formula wt.	Melting pt. (°C)	Boiling pt. (°C)	Density (at 20°C)	Viscosity at 20°C (cps)	Refractive index (at 20°C)	Flash pt. (°C)
Acetic acid	64-19-7	60.05	17	118	1.049	1.21	1.3716	40
Acetic anhydride	108-24-7	102.09	−73	140	1.082		1.3900	54

A. INTRODUCTION

Oligomers are defined as the low members of the polymeric–homologous series with molecular weights up to about 1000–2000. They are easily obtained by stepwise synthesis from suitably protected monomer derivatives or by separation from the polymers. As monodisperse oligomers are low molecular compounds of defined molecular weights, they represent ideal model substances for the polymers. By physical studies of a complete series of oligomers, substantial knowledge is gained of the relation between chain length and physical properties. In this way certain physical data of the polymers could be explained for the first time. In chemical aspects, oligomers must, on principle, have the same properties as the related polymers; they are, however, much more accessible to all studies, owing to their strictly defined and comparatively simpler structure.

Homologous oligomers differ sufficiently in their physical properties – due to their low molecular weight – so that they can be separated into individual chemicals. They can therefore be used for elucidating the structure of polymers and, in close relation, for the investigation of the mechanisms of polymerization. Oligomers are intermediates in polycondensation and polyaddition reactions and are present in more or less significant amounts in the polymers, due to equilibria between different chains, and between chains and rings. Therefore important conclusions on the structure of the related high polymers can be drawn from isolation and structure determination of oligomers, along with a comparison of the chemical properties of polymers and oligomers. In this way clear evidence can be obtained as regards the type of linkage between the monomer units in the polymer as well as the structure of unknown endgroups. Finally, unequivocal evidence on the mechanism of polymer formation is to be expected from the behavior of oligomers under the conditions of the polyreaction.

The following tables give the physical properties of the most important, linear, cyclic, and branched monodisperse oligomers which are significant for polymer chemistry. Derivatives and co-oligomers (such as co-oligo-peptides, -saccharides, and -nucleotides) as well as organosilicon and inorganic oligomers are not included, nor are any low polymers which have not been proved to be strictly monodisperse. Only those literature references are cited that indicate the best methods of synthesis and the most important physical properties of the oligomers concerned (including spectroscopic and conformational data which could not be mentioned in detail in the tables).

In the last few decades several reviews on linear and cyclic oligomers have appeared. A small list is giving below.

TABLE 2. OLIGO(DIENES)

2.1. OLIGOMERS OF 1,3-BUTADIENE

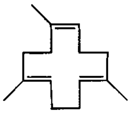
Oligomers	*n*	Mol. wt.	m.p. (°C)	b.p. (°C/mbar)	n_D/°C	Refs.
LINEAR DIMERS	2	108.2				
3-Methyl-1-*trans*-4,6-heptatriene CH_2=CH-CH(CH_3)-CH=CH-CH=CH_2				117/1013	1.4657/20	13,14,33,35,36,38
1,3,6-Octatriene CH_2=CH-CH=CH-CH_2-CH=CH-CH_3				129/1013	1.4743/20	33,36
1,3,7-Octatriene CH_2=CH-CH=CH-CH_2-CH_2-CH=CH_2						31,32,35,36,39
trans				124–125/1013	1.4686/20	39
cis				115–117/1013	1.4594/20	39
2,4,6-Octatriene (*cis*/*trans*) CH_3-CH=CH-CH=CH-CH=CH-CH_3				65–66/53		34,40,41
all-*trans*			52.5	147–148/1019	1.5131/27	34,40,41
$\Delta^{3,3'}$-Octahydro-diphenyl	3	162.3		230–232/1013		42,43
Vinylcyclopolyenes $[(CH_2CH{=}CHCH_2)_xCH(CH{=}CH_2)CH_2]$ (cyclic)						
4-Vinyl-1-cyclohexene (x = 1)	2	108.2		129–130/1013	1.4642/20	1-7,34-37,44,48,49
17-Vinyl-all-*trans*-1,5,9,13-cyclo-octadecatetraene (x = 4)	5	270.4		~136/1.3	1.5093/20	37
21-Vinyl-all-*trans*-1,5,9,13,17-cyclodocosapentaene (x = 5)	6	324.5		~170/1.3	1.5098/20	37
1,2-Divinyl-cyclobutane	2	108.2				
cis 				38/51	1.4563	1,8,48,49
trans 				112–113/1013	1.4451/20	8,44,48,49
CYCLOPOLYENES $[CH_2{-}CH{=}CH{-}CH_2]_n$ (cyclic)						
1,5-Cyclooctadiene	2	108.2				1,3-10,35-37
cis,cis			−70.1	150.8/1002	1.4936/20	1,4,8,9
trans,trans			−62		1.4933/20	4
1,5,9-Cyclododecatriene	3	162.3				5-7,10-12,35-37
trans,trans,trans			34	237.5/1013	1.5005/20	5-7,12,45,46
cis,trans,trans			−16.8	241.5/1013	1.5078/20	5,6,12,45-47
cis,cis,trans			−9 to −8	244/1013	1.5129/20	6,12,46
All-*trans*-1,5,9,13-cyclohexadecatetraene	4	216.4	19–20	~97/1	1.507/20	37
All-*trans*-1,5,9,13,17-cycloeicosapentaene	5	270.4		~142/1	1.5133/20	37
All-*trans*-1,5,9,13,17,21-cyclotetracosahexaene	6	324.5		~176/1	1.5133/20	37

2.2. OLIGOMERS OF ISOPRENE

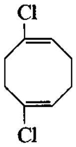
Oligomers	n	Mol. wt.	b.p. (°C/mbar)	n_D/°C	Refs.
LINEAR OLIGOMERS					
2,7-Dimethyl-1-*trans*-3,7-octatriene $CH_2=C(CH_3)-CH=CH-CH_2-CH_2-C(CH_3)=CH_2$	2	136.3	176/1013	1.4721/25	50,51
2,6-Dimethyl-1,3,6-Octatriene $CH_2=C(CH_3)-CH=CH-CH_2-C(CH_3)=CH-CH_3$	2	136.3	57–58/16	1.4794	6,30,52,27
2,7-Dimethyl-1-*trans*-3,6-octatriene $CH_2=C(CH_3)-CH=CH-CH_2-CH=C(CH_3)-CH_3$	2	136.3	54/13	1.4786/20	11,29,30
2,6-Dimethyl-1-*trans*-3,7-octatriene $CH_2=C(CH_3)-CH=CH-CH_2-CH(CH_3)-CH=CH_2$	2	136.3	167/1013	1.4704/25	50
3-Methyl-6-methylene-1,7-octadiene $CH_2=CH-C(CH_3)-(CH_2)_2-C(=CH_2)-CH=CH_2$	2	136.3	161/1013	1.4570/25	50
2,6,10-Trimethyl-1-*trans*-3,5,10-dodecatetraene $CH_2=C(CH_3)-CH=CH-CH=C(CH_3)-(CH_2)_3-C(CH_3)=CH-CH_3$	3	204.3	78/1.3	1.4963/20	53
7,11-Dimethyl-3-methylene-1-*trans*-6,11-dodecatriene (β-farnesene) $CH_2=C(CH_3)-(CH_2)_3-C(CH_3)=CH-(CH_2)_2-C(=CH_2)-CH=CH_2$	3	204.3	70/1.3	1.4786/20	53
2,6,10,14-Tetramethyl-1-*trans*-3,6,10,14-hexadecapentaene $CH_2=C(CH_3)CH=CH-[CH_2C(CH_3)=CHCH_2]_3=H$	4	272.5	160/1.3	1.5013/20	53
CYCLIC OLIGOMERS					
trans-1,2-Dimethyl-1,2-divinylcyclobutane 	2	136.3	134.5–135/992	1.4541/27	49
trans-1-Isopropenyl-2-methyl-2-vinylcyclobutane 	2	136.3	152.5–153/992	1.4591/27	49
trans-1,2-Diisopropenylcyclobutane 	2	136.3	155.1–155.4/987	1.4585/29	49
4-Isopropenyl-1-methyl-1-cyclohexene (dipentene) (D,L) 	2	136.3	178/1013	1.4727/18	15–17, 55,62,71
6-Isopropenyl-3-methyl-1-cyclohexene (diprene) (D,L) 	2	136.3	173–175/1000	1.4735/20	15,16, 59,71
2,4-Dimethyl-4-vinyl-1-cyclohexene 	2	136.3	162/1000	1.4654/20	11,29,30, 49,55, 58–60,71
1,4-Dimethyl-4-vinyl-1-cyclohexene 	2	136.3	160.5–161.5/988	1.4658/28	11,17,30, 49,53,55, 57–59,71
cis,cis 1,5-Dimethyl-1,5-cyclooctadiene 	2	136.3	182.4/988	1.4863/28	49,54, 56–59,71
cis,cis 2,5-Dimethyl-1,5-cyclooctadiene 	2	136.3	182.5–184/992	1.4870/27	49,54, 56–59,71

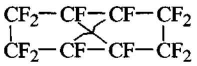
2.2. *cont'd*

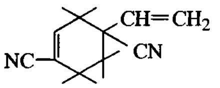
Oligomers	n	Mol. wt.	b.p. (°C/mbar)	n_D/°C	Refs.
1,5,10-Trimethyl-*cis,trans,trans*-1,5,9-cyclododecatriene	3	204.3	138/17	1.5120	61
					

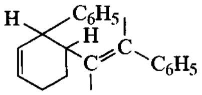


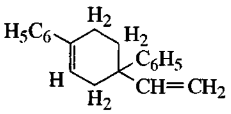
2.3. OLIGOMERS OF 1,3-BUTADIENE DERIVATIVES

Monomer	Oligomers	n	Mol. wt.	m.p. (°C)	b.p. (°C/mbar)	n_D/°C	Refs.
2-Chloro-1,3-butadiene	1-Chloro-4-(α-chloro-vinyl)-1-cyclohexene	2	177.1		53/1.2	1.5135/25	63–66
							
	1,6-Dichloro-1,5-cyclooctadiene	2	177.1	13.8	64/0.33	1.5339/25	9,63–66
							


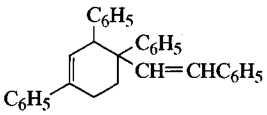
2,3-Dichloro-1,3-butadiene	3,4,7,8-Tetrachloro-1,5-cyclooctadiene	2	246.0	98–99	140–146/4.8		63
Hexafluoro-1,3-butadiene	Cyclic dimer	2	324.1	40	80/1013		20,21
							


2-Cyano-1,3-butadiene	4-Vinyl-1,4-dicyano-1-cyclohexene	2	158.2	55–56	110–112/1.3		69
							


1-Phenyl-1,3-butadiene	3-Phenyl-4-*trans*-styryl-1-cyclohexene	2	260.4		189–191/3		67
							


2-Phenyl-1,3-butadiene	1,4-Diphenyl-4-vinyl-1-cyclohexene	2	260.4	60	220–222/17		68
							


1,3-Diphenyl-1,3-butadiene	1,3,4-Triphenyl-4-*trans*-styryl-1-cyclohexene	2	412.3	137–138		18,19	
							



2.4. 1,4-OLIGO(ALKADIENES) CH_3CH_2–[CH_2–CX=CH–CH_2]$_n$–CH_2CH_3

X	n	Configuration	Mol. wt.	b.p. (°C/mbar)	n_D/°C	Refs.
H	1	*cis*	112.2	121.7/985	1.4136/20	87
		trans		121.4/985	1.4116/20	87
	2	All-*cis*	166.3	90–91/23	1.4455/23	85

TABLE 3. OLIGO(ACETYLENES)

3.1. LINEAR OLIGOMERS OF ACETYLENE

	n	Mol. wt.	b.p. (°C/mbar)	*d* (g/cm^3)/°C	n_D^{20}	Refs.
Vinylacetylene CH$_2$=CH–C≡CH	2	52.1	5/1009	0.705/0		1,2
Divinylacetylene CH$_2$=CH–C≡C–CH=CH$_2$	3	78.1	84.5–85/1013	0.772/20	1.5055	1–3
1,3-Hexadiene-5-yne *cis/trans* CH$_2$=CH–CH=CH–C≡CH	3	78.1	81–82/1013	0.780/28	1.4900	1,2,4–6,25
1,3,7-Octatriene-5-yne CH$_2$=CH–CH=CH–C≡C–CH=CH$_2$ (E)-: GC; ^{1}H-, ^{13}C-NMR; Ref. 7 (Z)-: GC; ^{1}H-, ^{13}C-NMR; Ref. 7	4	105.1	10/27	0.830/20	1.5834	1,2,7

3.2. POLYENYNE OLIGOMERS $(CH_3)_3C-[C\equiv C-CH=CH]_n-C\equiv C-C(CH_3)_3$

n	Mol. wt.	m.p. (°C)	Refs.
1	188.3	69–72	26
2	238.4	118–120	26
3	288.4	155–156	26
5	388.5	220 d	26
7	488.6	204 d	26

3.3. OLIGOMERIC α,ω-DIYNES $H[C\equiv C-(CH_2)_x-C\equiv C]_nH$

x	*n*	Mol. wt.	m.p. (°C)	b.p. (°C/mbar)	n_D/°C	Refs.
1	1	64.1	− 20 to − 19	63–64/1013		8
	2	126.1	65–66			8,9
	3	188.2	103–104			8
2	1	78.1		87.5–88.5/1011	1.4381/23	10
	2	154.2	99–100			11–14
	4	30.4	167–168 d			11,12
3	1	92.1	− 84.8	111.5/1013	1.4423/20	15
	2	182.3	∼ − 5	110–111/0.9		11,12
	4	362.5	60–61			11,12
4	1	106.2		93–95/253	1.4521/18	16
	2	210.3	21–22	119–120/0.1	1.5205/23	11,17
	4	418.6	93–94			11,17
5	1	120.2	− 27.3	162/1013	1.4490/20	15
	2	238.4	21–22		1.5119/26	11,12
6	1	134.2		68–71/18		18
	2	266.4	30–31			11,12
	4	530.8	59–61			11,12

3.4. OLIGO(ALKYNES) $H[C\equiv C-(CH_2)_x]_n-C\equiv CH$

x	*n*	Mol. wt.	m.p. (°C)	b.p. (°C/mbar)	n_D/°C	Refs.
1	1	64.1	− 21 to − 19	63–64/1013		8
	2	102.1	21–21.5		1.4833/22	8
	3	140.2	44–45			8
	4	178.2	73–74			8
	6	254.3	112–113.5			8
2	1	78.1		87.5–88.5/1011	1.4381/23	10
	2	130.2	46	61–63/3		19
4	1	106.2		93–95/253	1.4521/18	16
	2	186.2	− 3	111/1.3	1.4775/25	9
	3	266.4	19	167/0.4	1.4918/25	9
	7	586.9	36			9
	8	667.0	55			9
5	1	120.2	− 27.3	162/1013	1.4490/20	15
	2	214.3	8	113/1.1	1.4791/26	9
	3	308.5	33	170/0.1		9
6	1	134.2		68–71/18		18
	2	242.4	24	131/0.3	1.4806/25	9

3.5. CYCLIC OLIGO(ALKYNES) $\ulcorner[(C\equiv C)_x-(CH_2)_y]_n\urcorner$

x	*y*	*n*	Mol. wt.	m.p. (°C)	b.p. (°C/mbar)	Refs.
1	4	2	160.2	39	87/0.3	9,20,21
		4	320.5	71	215/0.3	9,20
	5	2	188.3	100	100–110/0.001	9,20
	6	2	216.4	− 3.5	110–120/0.001	20
	7	2	244.4	97	160–180/4	20
